FLOODS OF 1957

FLOODS OF JANUARY-FEBRUARY 1957 IN SOUTHEASTERN KENTUCKY AND ADJACENT AREAS

ABSTRACT

Heavy rains over an extensive area on January 27-February 2, caused extreme flooding in southeastern Kentucky and adjacent areas in West Virginia, Virginia, and Tennessee. Total rainfall for the storm period ranged from 6-9 inches over most of the report area and was 12½ inches at the eastern end of the Virginia-Kentucky State line.

The principal basins affected by the storm were those of the Big Sandy, Kentucky, Cumberland, and Tennessee Rivers.

Maximum discharge of record occurred in many streams. On Levisa Fork near Grundy, Va., the peak discharge of 33,200 cfs was 50 percent greater than the previous maximum in 17 years of record and was 3.3 times the mean annual flood. The peak discharges on tributaries of the Kentucky River and on the Holston and Clinch Rivers were also the greatest of record and those on the upper Cumberland River were nearly as great as those during the historic floods of 1918 and 1946.

Total flood damage was estimated at \$61 million of which \$39 million was in the Big Sandy River basin (mostly in Kentucky) and \$15 million was in the Kentucky River basin—\$52 million of the total damage was in Kentucky.

INTRODUCTION

Devastating floods occurred on the streams of southeastern Kentucky, southwestern West Virginia, western Virginia, and northeastern Tennessee in late January and early February 1957. The areas hardest hit included the headwaters of the Big Sandy, Kentucky, Cumberland, and Tennessee River basins (fig. 1).

The first 3 weeks in January were drier than normal, but, just prior to the flood, streams were at near-median levels and the ground was saturated due to 1-2 inches of rain a week earlier. The flood was attributable to these antecedent conditions and to the runoff generated by precipitation ranging from 4-9 inches during the period January 27-February 2.

Temperatures at the beginning of the storm were above normal and remained so during the period of heavy rainfall. Figure 2 shows variation in temperature at the Weather Bureau station, Hindman Settlement School, Hindman, Ky., near the center of the

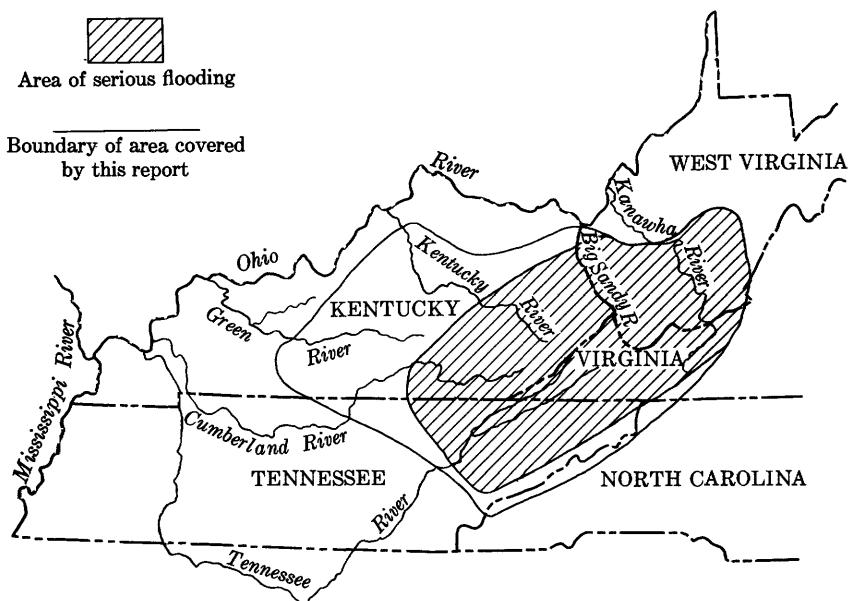

FIGURE 1.—Map showing area of this report.

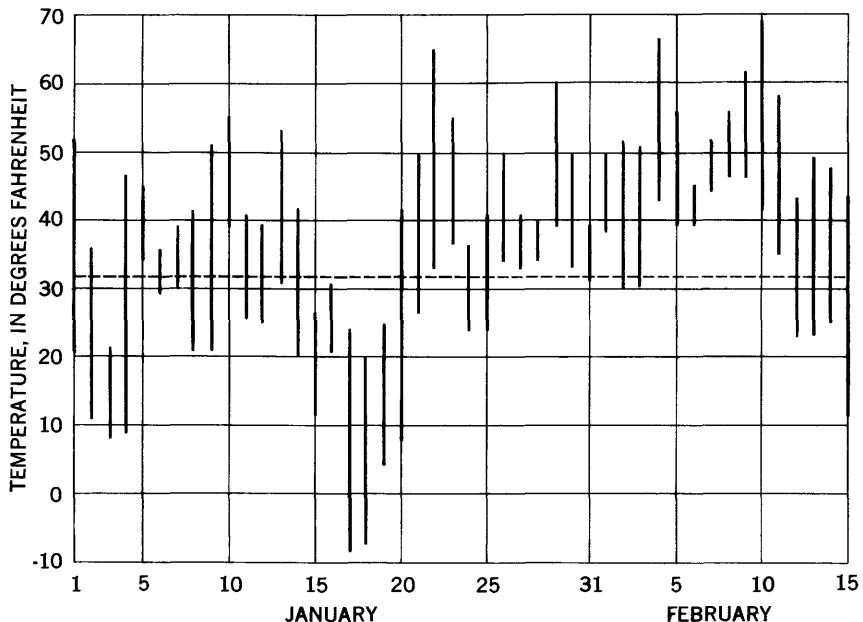

FIGURE 2.—Temperature variation of Hindman Settlement School, Hindman, Ky., January 1–February 15, 1957.

area of greatest flooding. Generally, temperatures began to rise on January 18 when the ground in most parts of the area was frozen to a shallow depth and there was $\frac{1}{2}$ -2 inches of snow on the ground. Thawing and melting occurred during the earlier rains on January 21-23.

Peak stages and discharges along Levisa Fork, the headwater tributary of the Big Sandy River, and its tributaries were the greatest of record except for those on tributaries in the Paintsville, Ky., area and downstream. Similarly, maximum discharges occurred along the North, Middle, and South Forks of the Kentucky River and most of their tributaries and in the Holston and Clinch Rivers. In the Green River basin precipitation was heavy in the area southeast of Bowling Green, Ky., and maximum stage and discharge were recorded on Drakes Creek. The upper Cumberland River reached stages that were nearly as great as the historic floods of 1918 and 1946. Poor Fork, the headwater tributary of the Cumberland, and Laurel River had peaks that exceeded all previously known peaks.

This report on the floods is made for the purpose of:

1. Presenting records of river stage and discharge in more detail than that published in the annual series of reports on surface water entitled "Surface-water supply of the United States."
2. Collecting and recording information, other than stages and discharges, pertinent to an analysis and understanding of the hydrology of the floods.
3. Recording the amounts of damages caused by the floods.
4. Recording the comparative magnitude of the subject floods and the known large floods of the past.

The Geological Survey maintains, in cooperation with State and Federal agencies, a network of stream-gaging stations where records of river stage and discharge are collected. The records thus collected for stations in the flood area (fig. 3) are published herein.

Data collection was under the supervision of the following district engineers: F. F. Schrader, Kentucky; D. S. Wallace, Virginia; W. R. Eaton, succeeded by J. S. Cragwall, Jr., Tennessee; and W. L. Doll, West Virginia. R. H. Tice, flood specialist assisted on indirect measurements of peak discharges and prepared the open-file release, "Floods of January-February 1957 in southwestern Virginia," which was incorporated in this report. Most of the text material, that for Kentucky, was contributed by N. O. Thomas. Data from the four districts was assembled and text material coordinated to cover the entire flood area by J. O. Rostvedt under the direct supervision of Tate Dalrymple, Chief of the Floods Section.

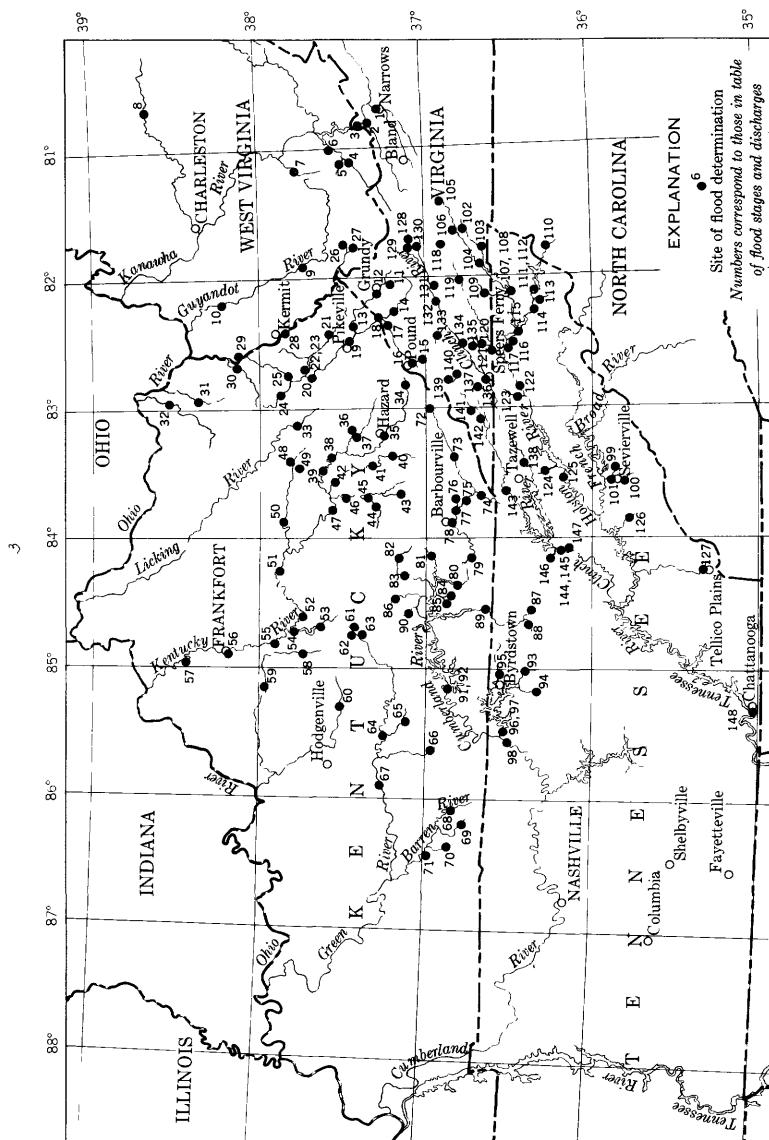

FIGURE 3.—Map of the flood area showing location of flood-determination points.

ACKNOWLEDGMENTS

Records of discharge in the area covered by this report were collected as part of the cooperative programs between the Geological Survey and the States of Kentucky, Virginia, Tennessee, and West Virginia; the Tennessee Valley Authority; and the Corps of Engineers.

The isohyetal map was prepared from data furnished by the Tennessee Valley Authority and by the Weather Bureau. Damage figures were furnished by the Corps of Engineers.

Acknowledgment of other data furnished is made where the data appears in the report.

GENERAL DESCRIPTION OF FLOODS

RAINFALL

The heaviest rainfall during the storm period, January 27–February 2, occurred in the Pikeville-Haysi area in Kentucky and along the Tennessee-North Carolina State line. Total rainfall for the period ranged from 6 to 9 inches over much of the area (fig. 4). Based on available records, bucket surveys, and other reports, the greatest total rainfall for the period January 27–February 1, was 12½ inches in the headwater area of the Middle Fork Kentucky River, a few miles from the Cumberland River drainage divide.

The low density of established rainfall stations in the area cannot be expected to define the variations resulting from strong orographic influences in the mountainous region. Bucket surveys were made in an attempt to fill the gaps, but these were only partly successful because catchments or other containers normally found on farms overflowed during the heavy storms. Also, it was difficult to distinguish rainfall caught antecedently, during the period January 21–23, from that of the main storm period. Similarly, trailing-off precipitation during the later general storm period, February 5–10, was difficult to distinguish in analyzing bucket-survey data.

THE FLOODS

The disastrous floods of January–February 1957 in southeastern Kentucky and adjacent areas were the result principally of heavy precipitation and of saturated ground at the beginning of the storm period on January 27. Severe flooding occurred in the headwater areas of the Big Sandy, Kentucky, Cumberland, and Tennessee Rivers.

The region of severest flooding was in Kentucky, which is characterized by narrow, deep valleys. The main highways, railroads, business establishments, and homes are built along the river banks or are confined to the relatively narrow floodplains. The flood rises were

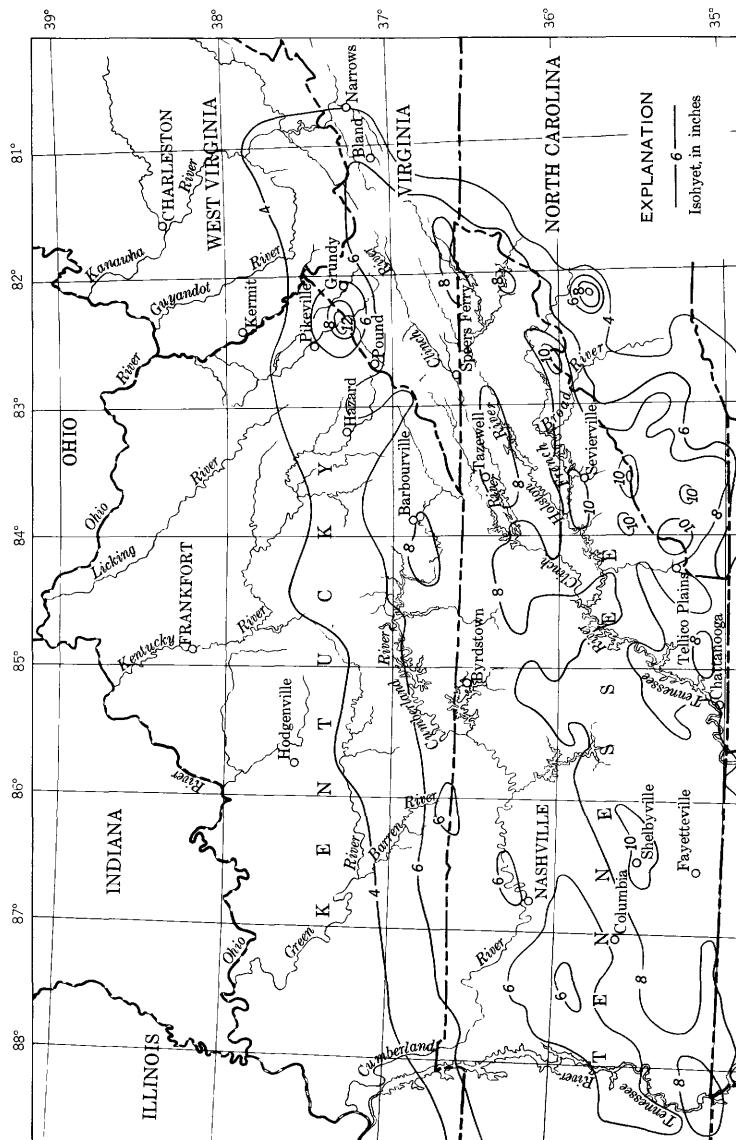

FIGURE 4.—Map of flood area showing isohyets, in inches, for the storm of January 27–February 2, 1957.

so rapid that many residents had to flee from their homes without their belongings. Communications were disrupted in many areas so that no flood warning was received or there was some question as to the reliability of the flood heights expected. Early warning might have prevented much damage to personal property, particularly to stocks and supplies in business houses. Food shortages developed as the result of extensive damage to stores. In some cities and towns, water supplies were contaminated and there was no gas for cooking. Approximately 7,700 telephones and 103 long-distance circuits were out of service. Electric power was disrupted, but generally, service was restored sooner than for other services.

In Kentucky the death toll was nine persons. The Red Cross reported that 597 homes were destroyed, 2,932 sustained major damage, and 8,740 suffered minor damage. At least 30 State and Federal highways were blocked by high water or rock and earth slides. Most of the secondary roads on hillsides above the flood levels were rendered impassable by the heavy rains.

Ample food and other relief supplies were made available by Federal and State agencies and by the Red Cross and other organizations. Flooding and damage to highways made it difficult to distribute the supplies to the people. The Army assigned a group of 14 helicopters to transport food, medical supplies, and clothing into the stricken area. The group was headquartered at London, Ky., along with Army Engineer and Transportation contingents from Fort Knox who were also employed in the distribution of supplies and in relief activities. Units of the National Guard were called to duty to distribute relief supplies, to perform security duties, and to assist in cleanup work.

President Eisenhower declared the flooded region a disaster area, thus mobilizing Federal agencies and making funds available for relief and rehabilitation. The Federal Civil Defense Administration coordinated the relief and rehabilitation work of Federal agencies.

States agencies reported that 90 percent of the coal mines in Pike, Floyd, Letcher, and Perry Counties in Kentucky were forced to close because of the water, disrupted communications, washed-out roads, or damaged railroad beds. Approximately 900 mines and manufacturing industries employing 28,000 persons in the 12 counties hardest hit either shut down or curtailed operations.

Many schools were closed due to damage or to the disruption of transportation. Several small rural school buildings were destroyed. The most serious school damage was that to the State Vocational School at Hazard, Ky., in Perry County, which was estimated by State officials to be \$373,000 and termed "almost a total loss." Damage to other schools in the county totaled about \$85,000. Damage to

schools in Floyd County was the next highest, being estimated at \$308,000.

Scores of cable-suspended footbridges, used to provide access to highways from residences located on the opposite bank of streams, were destroyed or damaged by the flood. Ninety-six of these bridges in the Kentucky River basin and approximately 140 in other basins of the area affected by severe flooding were lost.

BIG SANDY RIVER BASIN

In the upper reaches of Levisa Fork, the headwater tributary of Big Sandy River, the flood exceeded the previously known maximum of 1862. Levisa Fork and its large tributary, Russell Fork, have their sources in Virginia. The crests of both streams arrived at the mouth of Russell Fork at about the same time and contributed to the sharpness of the rise and extreme gage height downstream. The rapidity of the rise is illustrated by the discharge hydrograph for Levisa Fork at Pikeville, Ky. (fig. 5). The stream rose from about 18 feet on January 29 to a crest of 52.72 feet early on January 30, which exceeded the stage of about 52 feet recorded for the flood of 1862.

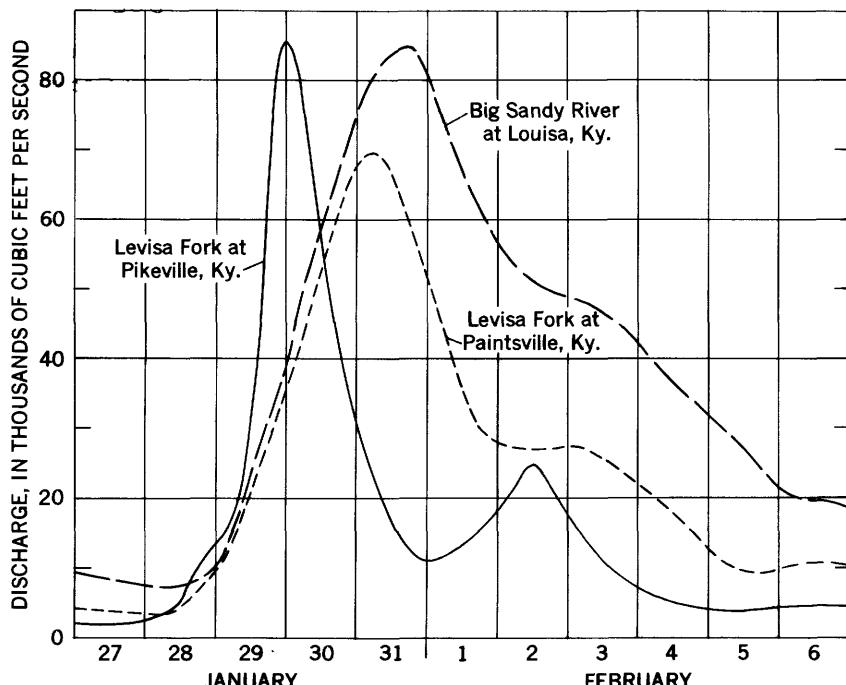

FIGURE 5.—Discharge at selected gaging stations in the Big Sandy River basin January 27–February 6, 1957.

The peak stage on January 31, 1957, at Paintsville, Ky., was about seven-tenths of a foot lower than that of the flood in 1862 but exceeded the previous maximum in 31 years of record by 3.8 feet.

Figure 5 also shows discharge hydrographs for Levisa Fork at Paintsville, Ky., and for Big Sandy River at Louisa, Ky. The time interval between peaks of the three gaging stations was not great.

Pikeville was almost entirely under water—for the first time since 1862—at the height of the flood. The maximum stage in 21 years of record (42.9 ft. in 1946) was exceeded by almost 10 feet. Water stood 3 feet deep or more in Main Street business houses and as much as 9 feet deep in some stores on other streets. Much food was contaminated and food shortages developed. Drinking water became polluted. Highways were submerged and the town was isolated. Police estimated that 400 automobiles were submerged. Telephone service was disrupted by the flood but was partially restored for emergency use as the waters receded.

More than 250 houses were destroyed in Pikeville and the immediate area. Approximately 2,400 houses were damaged and many families were evacuated. Pikeville city schools were closed, affecting 1,400 students. A month was required to repair flood damage to schools and return them to full operation.

To a lesser degree, Prestonsburg and Paintsville, Ky., and other smaller towns and communities on Levisa Fork and its tributaries suffered similar damage. Three-fourths of Prestonsburg (population 2,500) was under water, and approximately 1,000 persons were forced from their homes. As the waters receded, several fires broke out, which hampered rehabilitation work. The flooding in Prestonsburg is typical of the flooding that existed between the mainstream and hillsides in cities and towns along Levisa Fork.

About 700 residences in Paintsville were flooded. Advance warning received in Paintsville enabled 200 families to evacuate. The Prestonsburg and Paintsville (Johnson County) areas each suffered losses totaling \$4 million. Martin, Ky., a town of 1,100 population on Beaver Creek near its mouth, was damaged severely by backwater from Levisa Fork. Water reached the roofs of most business establishments in Martin. Elkhorn City, Ky., Fishtrap, Ky., and many communities suffered damage.

Two persons lost their lives in the Big Sandy River basin in Kentucky. A lineman was electrocuted at Pikeville, and a man was killed by exploding gas in Paintsville.

The greatest damage, by far, in any one area was at Pikeville and the surrounding area in Pike County—the largest county in Kentucky—damage exceeded \$15 million.

On the Pound River, the record flood at Pound, Va., and the near-record flood near Haysi, Va., caused extensive damage.

LITTLE SANDY RIVER, TYGARTS CREEK, AND LICKING RIVER BASINS

The Little Sandy River, Tygarts Creek, and Licking River basins are located on the fringe of the flood area. The magnitude of the floods were not outstanding in these basins and the headwater areas were affected to a small degree. There was some damage by flooding of the Licking River in Salyersville, Ky., but the principal damage was to agricultural lands in the upper part of the basin. The peak stage of 20.79 feet on Licking River near Salyersville had been exceeded 7 times since 1938.

KENTUCKY RIVER BASIN

The headwaters of the North, South, and Middle Forks of the Kentucky River were in or near the area of highest precipitation. The North Fork reached a peak stage of 37.54 feet at Hazard, Ky., as compared with the highest previous crest of about 34 feet on May 30, 1927. The three forks rose to unprecedented peak discharges, exceeding maximums recorded previously. The gaging stations have lengths of record as long as 24 years.

Discharges at the most downstream stations on the North Fork, Middle Fork, and South Fork Kentucky River are shown in figure 6. Although the maximum discharge at Jackson, Ky., was greater than any recorded previously, the peak stage was lower due to a cutoff, completed in 1956, half a mile below the gage. At the crest of the flood the cutoff was carrying approximately 75 percent of the flow. The Corps of Engineers estimated that the cutoff reduced the peak stage of the flood by about 4 feet.

On the Middle Fork Kentucky River at Buckhorn, Ky., the flood peak was 5.0 feet higher than the peak in 1939, and at Tallega, Ky., the crest stage was 2.83 feet higher than the historic flood of 1939.

In the South Fork Kentucky River basin the greatest flood previously recorded occurred in 1947. In January 1957 the peak discharge at Booneville, Ky., was 30 percent greater and the stage was 1.7 feet higher than that in 1947. Peak stage and discharge on the main stem of the Kentucky River at lock 14 at Heidelberg, Ky., 6 miles below the confluence of North and South Forks, were slightly less than that in 1939. Although most damage in the Kentucky River basin was to urban areas along the North, Middle, and South Forks, some damage was reported as far downstream as the mouth.

The worst hit town in the Kentucky River basin was Hazard, Ky., population 20,000. All highways leading into the town were blocked by the floodwaters, and all utilities were out of operation. The main

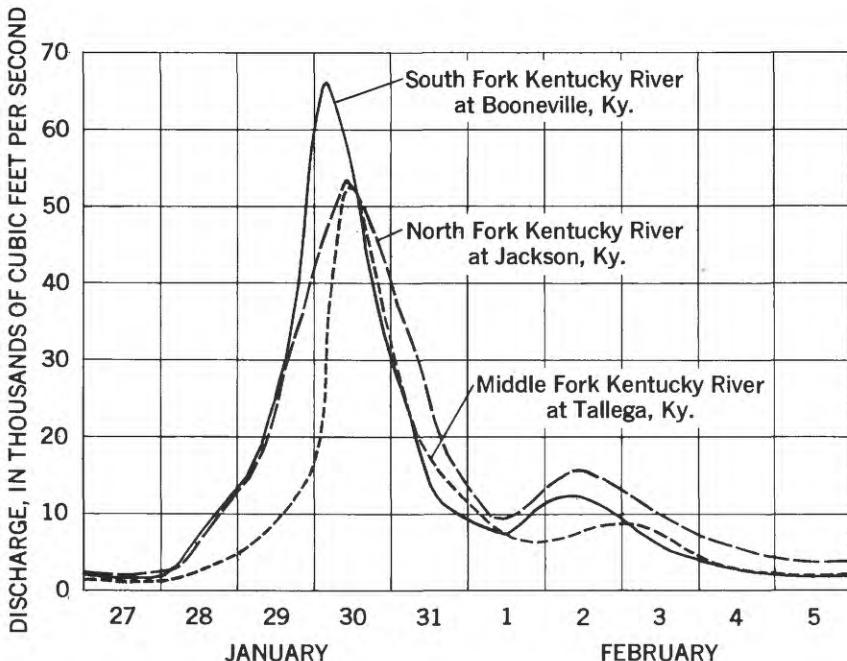

FIGURE 6.—Discharge at gaging stations in the Kentucky River basin.

streets of the town were inundated with as much as 17 feet of water. Five persons lost their lives in the Hazard area: three were drowned or died of exposure, and an elderly couple lost their lives at Darfork a few miles downstream when fire destroyed a house in which they had taken refuge. More than 300 residences and 180 commercial and industrial buildings were damaged in Hazard. At least 70 buildings of all types were destroyed. Total damages in the city amounted to about \$4½ million.

Most of the towns and communities located along the North Fork Kentucky River and its principal headwater tributaries, Rockhouse Creek, Line Fork, Leatherwood Creek, Carr Fork, and Troublesome Creek were damaged in some form. Damage was particularly notable at Whitesburg, Ky., and in the Neon-Fleming area upstream from Whitesburg on the North Fork; at Blackey, below the mouth of Rockhouse Creek; at Lothair, just upstream from Hazard; at Darfork, Airport Gardens, the airport, and Combs in the short reach below Hazard; and at Beattyville near the confluence of the North and South Forks. The greatest damage on tributary streams occurred along Leatherwood Creek.

The bridge serving the airport at Hazard was swept down river on January 29 (fig. 7). The photograph, taken on February 4, shows the erosive action of the waters on the far bank, which occurred before the bridge was lost.

The main business section of Beattyville, Ky., was inundated to a depth of about 6 feet, with 70 commercial establishments and 20 residences flooded. Thirty-five miles downstream at Irvine-Ravenna (lock 12) the peak stage was only eight-tenths of a foot below that of 1939, and about 25 residences in low-lying areas were flooded. In the 60-mile reach of the Kentucky River downstream from Irvine-Ravenna, wider flood plains exist and rural damage, particularly to cropland, was high.

FIGURE 7.—View of bridge at Hazard Airport, swept down by floodwaters of the North Fork Kentucky River. The airstrip paralleling the river in the background was submerged. Photograph by Louisville Courier-Journal and Times.

Many houses and other buildings were washed away, and some were lodged against bridges, partly obstructing the flow. This resulted in backwater and probably caused additional flooding and additional damage to bridges. Forty bridges were reported washed away in Letcher County, Ky.

In the Middle Fork Kentucky River basin, most of the urban damage was at Hyden and Buckhorn, Ky. There was much damage to rural residences and farm buildings along the Middle Fork and its principal tributary, Cutshin Creek. One person was drowned in Cutshin Creek at Wooton, Ky. In Hyden, a lumber company, the only industrial plant in town, lost a large amount of lumber, and 20 company residences were inundated. About half of the commercial properties and 30 percent of the residential properties in the town were affected.

At Buckhorn, Ky., the peak stage was 5.0 feet higher than that of 1939. Practically all properties in this town were inundated, some to a depth of 10 feet. Ten residences were destroyed.

In the South Fork Kentucky River basin, there was appreciable flood damage at Manchester and Oneida, Ky. Although Goose Creek at Manchester reached a stage about 2 feet lower than that of the historic flood of 1947, damage in the town was estimated at over \$200,000. Twenty-five residences and thirty-four commercial properties were flooded.

More than 50 residences and about 10 buildings of other types were flooded at Oneida, just below the confluence of Red Bird River and Goose Creek (head of the South Fork Kentucky River). Flow from Goose Creek cut across the town and approximately 80 percent of the property was inundated as much as 9 feet. At Booneville, Ky., the South Fork Kentucky River exceeded the peak stage of the flood of 1947 by 1.7 feet and damage was much less than that at Manchester. Thirty residences and one public building were flooded.

SALT AND GREEN RIVER BASINS

In the Salt and Green River basins, in the general fringe area of the flood, the most noteworthy peaks occurred in Barren River basin, which drains into the Green River from the south. Maximum discharge occurred at Drakes Creek near Alvaton, Ky. On Barren River at Bowling Green, Ky., the peak discharge was the second highest, and the peak stage was 2.56 feet lower than the previous maximum during the period of gaging-station record beginning in 1938, and its stage was about 10 feet less than the alltime high of 52.2 feet in 1913. Damage in the Green River basin was evaluated at \$788,000 by the Corps of Engineers, of which about two-thirds was noncrop agricultural damage.

Several of the peak flows recorded at gaging stations in the headwater areas of the Salt and Green Rivers did not occur during the main storm period, January 28–February 1, but were the result of other storms that passed over the State a week earlier or about 2 weeks later. Generally, the peaks at these stations were comparatively low and maximums were not approached.

CUMBERLAND RIVER BASIN

In the Cumberland River basin, the floods exceeded previously known maximum stages at four gaging stations. Poor Fork, the main headwater tributary, reached a maximum at Cumberland, Ky., exceeding by 1.3 feet the flood peak of 10.2 feet in 1927. A new maximum occurred at Laurel River at Corbin, Ky. The Cumberland River at Williamsburg, Ky., reached a stage of 33.78 feet, which is only four-tenths of a foot less than that of the flood in January 1946. Straight Creek had a discharge of 310 cfs per sq mi (cubic feet per second per square mile) from a drainage area of 53.8 square miles.

Discharge hydrographs at the Harlan, Pineville, and Williamsburg gaging stations on the main stem of the Cumberland River are shown in figure 8.

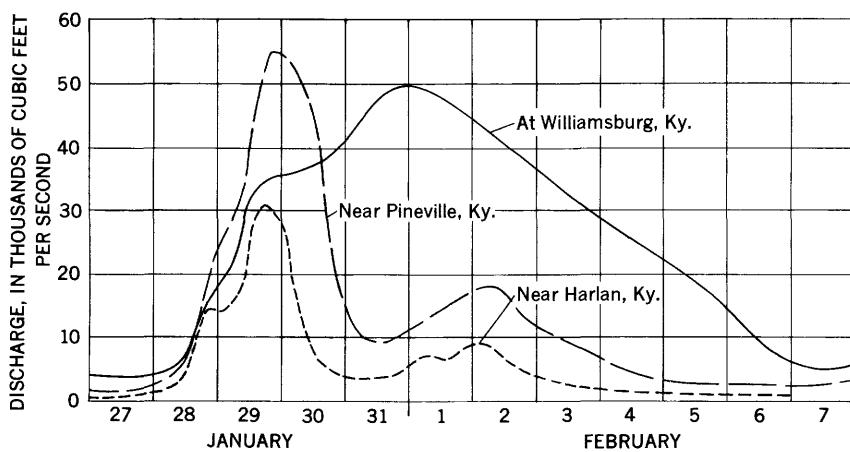

FIGURE 8.—Discharge at gaging stations on the main stem upper Cumberland River.

Based on records beginning about 1940, the floods of January 1946 are the greatest known, though floods in 1927 may have been somewhat greater along Poor Fork. It is noteworthy that the peak discharges during the January–February 1957 floods at most of the gaging stations missed reaching historical maximums by small amounts.

In the Cumberland River basin the greatest impact of the flood was upon the cities and towns along the main stem of the river. Poor Fork, the main headwater tributary, flooded an appreciable part of the business district of the town of Cumberland (fig. 9). There were 53

FIGURE 9.—View of flooded main street and business district in Cumberland, Ky., on January 29, 1957, at about 4 p.m. Bridge over Poor Fork in left foreground is partly blocked by submerged debris. Photograph by Vic Howard, Cumberland, Ky.

commercial establishments and 2 industrial enterprises moderately to severely damaged. More than 200 homes were flooded—17 were rendered unfit for further habitation. The flooding was aggravated by backwater from bridges that were blocked by debris. The peak stage of 11.50 feet at the gaging station downstream in the town was more than a foot higher than that of the flood of 1927 and almost 2 feet higher than that of the flood of 1946.

At Nolansburg, Ky., about 10 miles southwest of Cumberland, a man was drowned when a cable-suspended footbridge was washed out by the floodwaters. This was the only loss of life in the Cumberland River basin.

Near Harlan, just below the confluence of Poor and Clover Forks, the peak stage of the Cumberland River was 2.9 feet below the crest in 1946. Damage at Harlan was negligible although that in Harlan County, including Cumberland and Blair, Ky., was estimated at \$1 million.

The peak discharge at the gaging station near Pineville was slightly less than that during the flood of 1946, and the peak stage of 47.35 feet was about 2.0 feet lower. The pumps at a newly completed flood-wall at Pineville were not operational at the beginning of the floods, but emergency pumps were ready for use only a few hours before needed on January 29. Damage was relatively minor. Approximately 20-25 houses not protected by the wall were flooded.

At Barbourville, Ky., the peak stage was only half a foot below the known maximum of 42.8 feet in 1946. Approximately 80 percent of the city was inundated to depths as much as 10 feet, and about 200 families (600-800 persons) were evacuated. Damage to residential, commercial, and municipal properties exceeded \$1 million.

The aerial view in figure 10 shows flooding in the southern part of Barbourville in the vicinity of the stream-gaging station. The local flood-protection works, of which the levee shown in the photograph is a part, were not completed at a point downstream (off photograph to left) where Richland Creek enters the Cumberland River. Nevertheless, the completed part of the levee afforded considerable protection to the city with a corresponding reduction in damage, for it

FIGURE 10.—Aerial view of flooding in southern part of Barbourville, Ky., along the Cumberland River at 2 p.m., January 30, 1957. The levee that shows in this view looking north was not completed, but it prevented water from flowing through the city. Photograph by Louisville Courier-Journal and Times.

prevented the direct current of the river from flowing through Barbourville. The planned protected area of the city was subject only to backwater, and water elevations in the upstream end of town were less than those in the river near that area.

Williamsburg is on low rolling hills and was damaged much less than other areas. Water was 3 feet deep in some streets, but only a few families were forced to move. Damage totaled about \$70,000.

The hydrologic significance of the floods is demonstrated by the maximum discharge attained at Cumberland Falls, Ky., where 46 years of record are available. The discharge was only 4 percent less than the previous known maximum of 59,600 cfs in 1918.

Damage in Corbin was extensive. Approximately 400 residences, 90 business establishments, 2 industries, and several schools and churches were inundated to depths as much as 10 feet in parts of the city. Total damage exceeded \$2 million in the vicinity. Lynn Camp Creek, a tributary of Laurel River, flows through the city and numerous older residents in the city said that it was 5-6 feet higher than in any other flood during the past 50 years.

Rockcastle River did not reach a particularly high stage. Buck and Pitman Creeks approached the maximums of 5 years of record. The South Fork Cumberland River, with headwaters in Tennessee, had a discharge of 61,500 cfs near Stearns, Ky., which was about 12 percent less and had a stage about 2.2 feet less than the maximum during the period of gaging-station operation (1942-56). The peak stage of 36.25 feet was far below that of 52.9 feet in March 1929.

The flood was one of the greatest known in the Cumberland River basin, yet the discharge in the Cumberland River at Rowena, Ky., during the entire flood period was relatively small. The flow in the river at Rowena is regulated by Lake Cumberland (final closure of the dam was made August 1950) and the daily mean discharge during the period January 29-February 1 ranged from about 10,000-24,000 cfs, whereas the peak discharge during the flood of 1946 was 162,000 cfs.

The greatest daily increase in contents in Lake Cumberland was 282,500 cfs-days on January 29. The reservoir cannot be credited with reducing the flow at Rowena by an amount equal to the increase in storage at any given time.

Under natural uncontrolled stream conditions the rate of discharge at Rowena would not have been equivalent to the rate of increase that occurred in reservoir contents. The composite effect of the normal lag pattern of the individual streams, in such a long basin, could be considerably different than that of the various streams discharging directly into the reservoir.

A synthetic discharge hydrograph of unregulated discharge could be computed by flood routing studies, but that is beyond the scope of this report.

Figure 11 shows the great difference between the net inflow to the

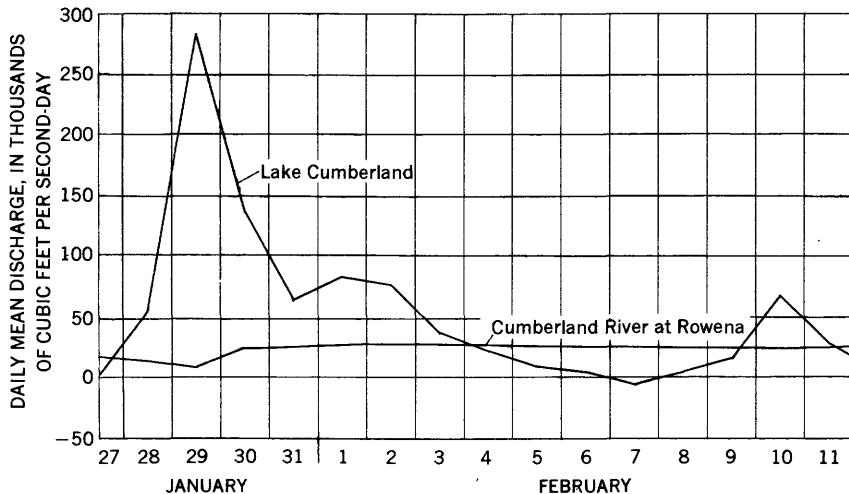

FIGURE 11.—Hydrograph of daily mean discharge of the Cumberland River at Rowena, Ky., and net inflow to Lake Cumberland.

reservoir and the discharge of the Cumberland River below the dam.

The peak discharge (22,600 cfs) in the Wolf River near Byrdstown, Tenn., was 60 percent greater than any other peak since at least 1948. The discharges of the Wolf River and the Obey River were regulated by Dale Hollow Reservoir near Celina, Tenn., and the peak discharge was modified to 6,160 cfs on January 29 below the reservoir.

TENNESSEE RIVER BASIN

In the Tennessee River basin in Virginia and Tennessee the flooding was most intense in the unregulated reaches in the Clinch and Holston River basins and in the small streams originating on the western slopes of the Great Smoky Mountains.

New maximums for the period of gaging-station record (33 and 39 years) occurred in the Clinch River above Tazewell, Tenn., and the Tellico River at Tellico Plains, Tenn. At Chattanooga, Tenn., the Tennessee River reached flood stage for the first time since 1948, and many families were evacuated from the low-lying sections of the city.

Although an unusually large amount of runoff was produced by the continued heavy rains most of the crests were relatively moderate.

More than 300 families were evacuated at Sevierville, Tenn., as floodwaters from the Little Pigeon River rose to a depth of 3 feet in the residential and business districts. Floods on the Elk River at Fayetteville and the Duck River at Columbia and at Shelbyville, Tenn., forced evacuation of many families from their homes. Discharges were not determined at these points. Lowlands and roads were flooded at scattered points across Tennessee except on the Cumberland Plateau.

A noteworthy feature of the floods was the large volume of runoff produced by the continued heavy rains. Inflow into reservoirs on Tennessee River tributaries was greater than at any time since the dams were built. The maximum volume stored in the reservoirs above Chattanooga was 3,700,000 acre-feet and the total in the entire Tennessee River reservoir system was 6,700,000 acre-feet.

Tennessee Valley Authority officials estimated that if the reservoirs had not been built the peak stage at Chattanooga would have been about 54 feet (412,000 cfs) on February 3, whereas the actual crest was 32.24 feet (208,000 cfs) on February 2. This flood under natural conditions would have been the second highest ever known at Chattanooga, being exceeded only by that of 1867.

Figure 12 shows the volume of water stored in the reservoir system during the flood period. Each graph shows the total storage in all reservoirs named below it. The vertical difference between any two graphs represents the storage in the reservoir or group of reservoirs indicated between them. For example: on February 10, the total storage in Norris Reservoir and the reservoir system upstream from it was 1,530,000 cfs-days, and that in Norris Reservoir alone was 390,000 (1,530,000–1,140,000) cfs-days.

FLOOD DAMAGE

The floods of January-February 1957 in southeastern Kentucky and adjacent areas in West Virginia, Virginia, and Tennessee caused record damage. Nine lives were lost in Kentucky.

Because the amounts of flood damage are frequently used as guides in the study of flood-control economics, and because some flood damage statistics are a measure of the relative magnitude of inundation, especially in urban areas, it has been the practice of the Geological Survey to compile available damage statistics in their special reports on floods. On-the-spot surveys of flood damage are not made by the Geological Survey.

Personnel of the Corps of Engineers from the Huntington, W. Va., Louisville, Ky., and Nashville, Tenn., district offices began collecting data on flood damage soon after the floodwaters receded (tables 1-5). The data in the tables are published as furnished by the Corps of

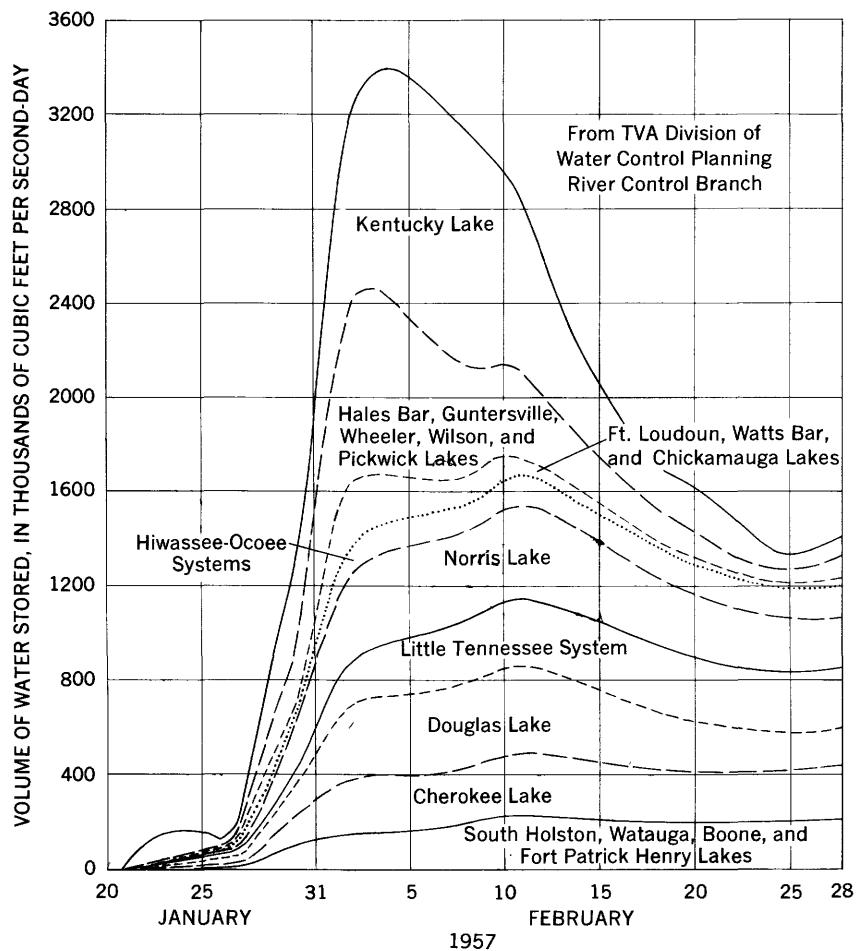

FIGURE 12.—Volume of water stored in the TVA reservoir system. Each line shows the total storage in all reservoir lakes named below it.

Engineers; except the breakdowns by stream reach or location were combined in some cases to permit shorter tables. In some instances, stage-damage curves that incorporated all direct damages in one total were used. These curves were constructed from data gathered in earlier floods but were checked and adjusted as necessary immediately following the January-February 1957 flood.

Table 1 lists direct damage to all improvements including dwellings, outbuildings, farm buildings, commercial and industrial property, and schools and churches in the Big Sandy River basin.

Flood losses in the Licking, Kentucky, and Green River basins shown in table 2 include the damage or destruction of real and personal property in urban and rural areas, crop and noncrop damage,

interruption of business activities, and damage to highways, railroads, and utilities. Under urban damage the following building units were flooded or destroyed:

	<i>Residential</i>	<i>Public</i>	<i>Industrial and commercial</i>	<i>Other</i>
Kentucky River Basin-----	1,559	60	490	54
Green River basin-----	57	4	2	9
Total-----	1,616	64	492	63

Grand Total.....	9,603,400	6,668,303	16,271,703

¹ Furnished by Louisville & Nashville Railroad.

The flood occurred during the winter—the low point of the crop season—and relatively light crop losses occurred in the inundated areas. Noncrop losses in rural areas were many times greater and consisted primarily of damage to buildings, building contents, lands, and stored crops. Land inundation amounted to 8,000 acres in the Licking River basin, 70,850 acres in Kentucky River basin, and 157,100 acres in Green River basin.

Rural damage in the Kentucky River basin (table 2) included damage to highways, roads, and bridges, \$662,000; to coal mines and business losses in coal mining operations, \$1,015,000, with 600–700 mines affected; and to suspension footbridges over streams. There were 96 suspension footbridges destroyed and replacement of these bridges cost approximately \$240,000. Railroad trackage (single) totaling 142 miles was damaged to some degree. In the Green River basin, highway damage was assessed at \$119,000 and railroad damage at \$31,000.

Table 3 summarizes damages of noncrop losses from inundation of 68,000 acres of farm land along the Ohio River, 76,700 acres in Wabash River basin, and 9,100 acres in Saline River basin.

In areas represented by table 4, acres of farm land inundated and corresponding damages in the reach from the mouth of the Cumber-

TABLE 3.—*Rural damage along Ohio River main stem and in Wabash and Saline River basins, Ohio, Indiana, Illinois, and Kentucky*

[Compiled by Corps of Engineers, Dept. of the Army, Louisville, Ky., district. Urban damage along Ohio River and in Wabash and Saline River basins was negligible]

	Rural damage			
	Ohio	Indiana	Illinois	Kentucky
Along Ohio River main stem, Neville, Ohio, to mouth.....	\$1,000	\$79,000	\$102,000	\$108,000
Wabash River basin.....	0	500	89,500	0

DETERMINATION OF FLOOD DISCHARGES

The operation of a stream-gaging station consists principally of the measurement of stage and discharge to define a stage-discharge relation from which discharge can be calculated for a given stage. The general method of determining discharge at gaging stations involves computing the stage-discharge relation from current-meter measurements of discharge at stages varying from low to high water and applying this relation to the records of stage. Short extensions of the stage-discharge relation curve are made by logarithmic plotting, from velocity-area studies, or by use of other measurable hydraulic factors.

In the area of major flooding (fig. 3), most of the stream channels are rocky or have numerous rock ledges, and thus are subject to relatively small amounts of scour or fill. At a few gaging stations in this report, fall (or slope) in the reach between two gages was a factor in establishing the relation between stage and discharge at medium and high stages and was considered in computing the discharge data.

During major floods it is often impossible to obtain current-meter measurements because of insufficient notice of flood stage on rapidly changing streams, impassable roads, heavy floating debris, or destruction of structures from which flood measurements are made. Because of this, the stage-discharge relation at a number of gaging stations affected by the flood was extended to peak flow by indirect measurements such as: Computation of flow over roadways or through contracted openings, slope-area measurement, or a combination of these methods. At several miscellaneous sites where high runoff occurred, the peak flow was also determined by indirect measurement.

STAGES AND DISCHARGES AT STREAM-GAGING STATIONS

EXPLANATION OF DATA

The purpose of this report is to present detailed information regarding stages and discharges of streams during the floods of January–February 1957. Much of the information is in addition to the records usually published in the annual series of Surface Water Supply Papers. The data are presented in sufficient detail to be used in studies relative to flood-control measures and watershed development.

The systematic collection of data at a stream-gaging station includes a record of stage, measurements of discharge, and any other general information pertinent to the determination of the daily flow of the stream at the gaging station. The record of stage is obtained either from periodic readings of some type of nonrecording gage or from an automatic water-stage-recorder installation, which provides a continuous graphic record of stage. Measurements of discharge are generally made by current meter.

The last section (Streamflow data) of this report consists, in general, of a description of the gaging station, a table showing the daily mean discharges for 2 months, January and February 1957, and a table of stages and discharges at indicated times for many of the stations during the flood period in late January and early February 1957.

The description of the gaging station gives information of location, datum, type of gage, and size of drainage area. The method of determining the stage and the definition of the stage-discharge relation throughout the ranges of stage experienced during the 1957 floods and the stage-discharge relation of the previously recorded maximum flood are described. The maximum stage and discharge are given for the January–February period and for the period of previous record. Information regarding floods outside the period of gaging-station record also is given in as much detail as is available.

Remarks on cooperation, regulation and diversion, and other pertinent information are included where applicable.

The table of daily mean discharges is presented for January and February 1957. This period was chosen so as to show the relation of the flood discharges to the discharges of the preceding and the following periods. The table also shows the monthly mean discharge and the volume of runoff, in inches.

The table of stages and discharges at indicated times is presented generally for the period starting January 27 until the recession reached the point where sufficient definition is furnished by the table of daily mean discharges and is not given for most stations outside of the areas flooded.

The stages at most stations were obtained from records of continuous water-stage recorders. If the water-stage recorder was not functioning properly, the interrupted stage graph was completed on the basis of a floodmark or supplemental gage readings, or by comparison with records on the same stream or nearby streams. For stations at which the records of stage consisted of one or more gage reading each day, a stage graph was drawn from these readings, from floodmarks, and by comparison with nearby stations. Details of the methods used in defining the stage record are given in the section of the description concerning the gage-height record.

The stations are numbered and arranged in downstream order from headwater to mouth, with stations on tributaries inserted in corresponding order, and following the order in which the tributaries enter the main stream. The reference number preceding the name of the gaging station is the same as that used on figure 3 and will aid in identifying the site.

SUMMARY OF FLOOD STAGES AND DISCHARGES

The maximum flood flows at stream-gaging stations and other sites on streams in the area covered by this report are summarized in table 8. The reference number is the same as that designating the site on figure 3 and will aid in identifying the location at which the discharge was determined.

In table 8, the first column under maximum floods shows the period of known floods prior to January 1957. This period does not necessarily correspond to that in which continuous records of discharge were obtained, and in some cases it extends back to an earlier date. More than one period of record are shown for some stations. Time periods are shown when they can be associated with a maximum stage even though the corresponding discharge is not known—a second period of known floods is then given in which the maximum discharge and stage are both known.

TABLE 8.—Summary of flood stages and discharges, southeastern Kentucky and adjacent areas

⁴ Elevation in ft.

⁵ Contents in thousands of acre-ft.

⁶ Affected by backwater from Levisa Fork.

⁷ Appreciably regulated by reservoir or reservoirs.

⁸ Prior to 1915.

⁹ At site three-fourths of a mile downstream.

¹⁰ Occurred in many years.

¹¹ At site nine-tenths of a mile downstream.

¹² Affected by backwater from Ohio River.

¹³ At site two-tenths of a mile downstream at same datum.

¹⁴ Part of drainage area is noncontributing; see station description.

¹⁵ Affected by backwater from ice.

¹⁶ Affected by backwater from debris.

¹⁷ At site 300 ft upstream at datum 1 ft higher.

¹⁸ Affected by backwater from Cumberland River.

¹⁹ At site 400 ft downstream at same datum.

²⁰ At site upstream; drainage area, 427 sq mi.

²¹ At site 2 miles upstream at datum 8.47 ft higher.

²² At site 400 ft downstream at datum about 1 ft higher.

²³ At Walnut St.

The second column under maximum floods shows the year in which the maximum stage or discharge occurred.

The third column under maximum floods gives the date of the maximum stage or discharge during the flood period January–February 1957.

Some of the stages and discharges listed in the table are affected by regulation, backwater, or other factors. These effects are indicated in footnotes and may be more fully described in the corresponding station description in the section of station data.

The discharges for gaging stations were determined as described in the preceding section, "Stages and discharges at stream-gaging stations." Discharges for points not regularly gaged have been determined by indirect measurements. These methods of measurement are named in the section, "Determination of flood discharges." The flood discharges and stages are given as observed; some may be affected by storage, backwater, or miscellaneous factors that would make the figures only partly representative of natural conditions. The user should consult the report (see section, "Streamflow data") to determine the degree of such factors at any station.

FLOOD FREQUENCIES

In table 8, the last column under maximum floods gives the ratio of the peak discharge of the floods of January–February 1957 to $Q_{2.33}$, the mean annual flood. By definition, the mean annual flood is an annual flood (highest momentary peak discharge in a water year) having a recurrence interval of 2.33 years.

The ratios given in the table were computed from two Geological Survey frequency studies: "Floods in Kentucky, Magnitude and Frequency," U.S. Geological Survey open-file report and "Floods in Tennessee, Magnitude and Frequency," Tennessee Department of Highways.

Throughout a region of uniform flood-frequency characteristics, a relation exists between the ratio of an annual flood to the mean annual flood and the recurrence interval of the annual flood. However, this does not apply to highly regulated streams and in many cases data are not available to compute the ratio for small drainage areas.

The streamflow stations in Kentucky and Tennessee used in this report lie in four regions, each having different flood-frequency characteristics:

Region 1 includes the basins of Big Sandy River, Tygart Creek, upper Licking River, Kentucky River and tributaries above the mouth of Red River, Green River above the mouth of Barren River, that part of Cumberland River that lies in Kentucky, and a few stations in the adjacent areas of Virginia and West Virginia.

Region 2 is the main stem of Kentucky River below the mouth of Red River.

Region 3 is that part of Kentucky not in regions 1 and 2.

Region 4 is the report area that lies in Tennessee.

An estimate of the recurrence interval of a given peak discharge at any station for which a ratio is known can be made from figure 13.

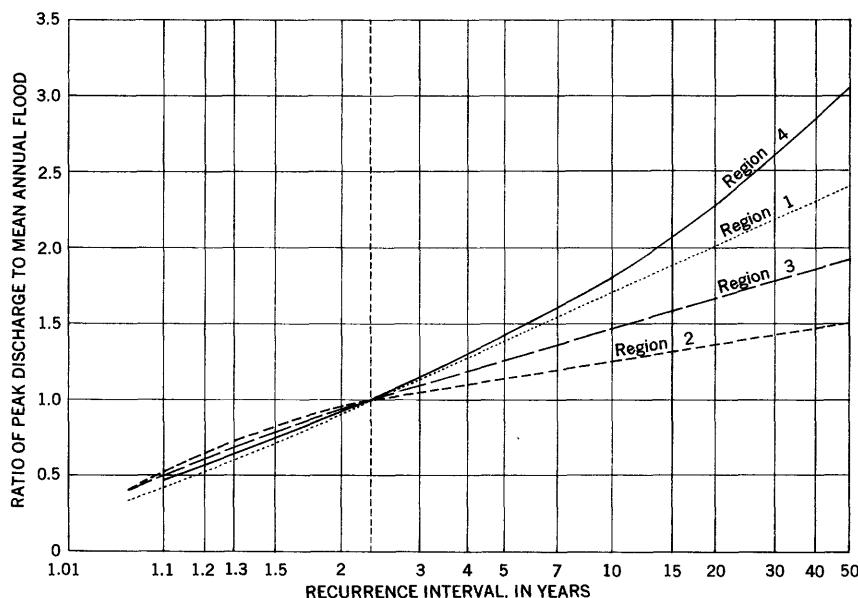

FIGURE 13.—Frequency of floods in Kentucky and Tennessee.

By using the ratio of a given flood to the mean annual flood of the same station (ordinate) and the frequency curve for the appropriate region, the recurrence interval may be determined on the abscissa.

STREAMFLOW DATA

KANAWHA RIVER BASIN

1. WALKER CREEK AT BANE, VA.

Location.—Lat $37^{\circ}16'05''$, long $80^{\circ}42'35''$, on left bank 0.2 mile downstream from bridge on State Highway 100 at Bane, Giles County, 0.2 mile downstream from Sugar Run, and 7.9 miles upstream from mouth.

Drainage area.—305 sq mi.

Discharge record.—Water-stage recorder graph. Datum of gage is 1,665.92 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 7,200 cfs and by slope-area measurement at 16,500 cfs.

Maxima.—January–February 1957: Discharge, 16,500 cfs 1 a.m. Jan. 30 (gage height, 16.50 ft).

1938 to December 1956: Discharge, 13,700 cfs June 17, 1949 (gage height, 14.44 ft).

Maximum stage known, about 23.5 ft in September 1878.

Mean discharge, in cubic feet per second, 1957

2. WOLF CREEK NEAR NARROWS, VA.

Location.—Lat $37^{\circ}18'20''$, long $80^{\circ}51'$, on right bank at downstream side of bridge on State Highway 61, 2.8 miles southwest of Narrows, Giles County, and 3.5 miles upstream from mouth.

Drainage area.—223 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,583.85 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 5,700 cfs and by contracted-opening measurement of 12,700 cfs.

Maxima.—January–February 1957: Discharge, 12,900 cfs 10 p.m. Jan. 29 (gage height, 12.55 ft in gage well and 13.8 ft, from floodmarks, at downstream side of bridge).

1908–16, 1938 to December 1956: Discharge, 11,000 cfs July 16, 1916 (gage height, 13.0 ft, from floodmarks).

3. NEW RIVER AT GLENLYN, VA.

Location.—Lat $37^{\circ}22'20''$, long $80^{\circ}51'45''$, on right bank at upstream side of bridge on U.S. Highway 460 at Glenlyn, Giles County, 0.3 mile upstream from East River and 6.3 miles downstream from Wolf Creek.

Drainage area.—3,768 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,489.76 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 65,000 cfs and by slope-area measurement at peak stage.

Maxima.—January 1957: Discharge, 57,800 cfs 12 p.m. Jan. 29 (gage height, 12.59 ft).

1927 to December 1956: Discharge, 226,000 cfs Aug. 14, 1940 (gage height, 27.50 ft), from rating curve extended as described above.

Flood of Sept. 13, 1878, reached an estimated stage of 33.1 ft, at Narrows, 6.5 miles upstream at different datum (discharge, 240,000 cfs, from stage-discharge relation defined by current-meter measurements to 17,500 cfs and extended above by logarithmic plotting).

4. BLUESTONE RIVER NEAR SPANISHBURG, W. VA.

[Gaging station, discontinued 1952]

Location.—Lat $37^{\circ}26'00''$, long $81^{\circ}06'40''$, on right downstream abutment of bridge on U.S. Highways 19 and 21, 1.1 miles southeast of Spanishburg, Mercer County, 1.4 miles upstream from Rich Creek, 1.7 miles downstream from Blacklick Creek.

Drainage area.—199 sq mi.

Gage-height record.—Crest-stages only. Datum of gage is 2,051.13 ft above mean sea level, adjustment of 1912.

Discharge record.—Stage-discharge relation defined by current meter measurements below 5,000 cfs.

Maxima.—January–February 1957: Discharge, 7,900 cfs Jan. 29, crest-stage gage height, 19.6 ft.

1944 to September 1952 (discontinued). Discharge, 6,920 cfs Jan. 8, 1946 (gage height, 18.36).

5. CAMP CREEK NEAR CAMP CREEK, W. VA.

Location.—Lat $37^{\circ}30'15''$, long $81^{\circ}07'40''$, on left bank 1,500 ft downstream from Mash Fork and 2.1 miles upstream from town of Camp Creek, Mercer County.

Drainage area.—32.0 sq mi.

Gage-height record.—Water-stage recorder graph. Altitude of gage is 2,050 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current meter measurements.

Maxima.—January-February 1957: Discharge, 3,410 cfs 12:30 p.m. Jan. 29 (gage height, 6.35 ft).

1946 to December 1956: Discharge, 2,720 cfs Feb. 14, 1948 (gage height, 5.84 ft).

7. PINEY CREEK AT RALEIGH, W. VA.

Location.—Lat $37^{\circ}45'40''$, long $81^{\circ}09'50''$, on left bank at Raleigh, Raleigh County, 0.5 mile downstream from Whitestick Creek, 0.5 mile upstream from Beaver Creek, and $1\frac{1}{2}$ miles southeast of Beckley.

Drainage area.—52.2 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 2,087.24 ft above mean sea level, datum of 1929, supplementary adjustment of 1944.

Discharge record.—Stage-discharge relation defined by current meter measurements.

Stage-discharge relation affected by ice, Jan. 3, 18–20.

Maxima.—January–February 1957: Discharge, 2,500 cfs 5:45 p.m. Jan. 29 (gage height, 5.78 ft).

1951 to December 1956: Discharge, 2,470 cfs Mar. 6, 1955 (gage height, 5.73 ft).

8. ELK RIVER AT SUTTON, W. VA.

Location.—Lat 38°39'45", long 80°42'35", near left bank on downstream side of pier of highway bridge at Sutton, Braxton County, half a mile upstream from Granny Creek and 2½ miles downstream from Wolf Creek.

Drainage area.—543 sq mi.

Gage-height record.—Water-stage recorder graph, except, Jan. 2-3, 15-20 for which graph was constructed from range of stage of recorder graph and from once-daily wire-weight gage readings by Weather Bureau. Datum of gage is 808.03 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current meter measurements below 29,000 cfs and extended above by logarithmic plotting.

Maxima.—January-February 1957: Discharge, 34,200 cfs 11 p.m. Jan 29 (gage height, 31.27 ft).

1938 to December 1956: Discharge, 32,300 cfs Oct. 16, 1954 (gage height, 29.42 ft).

Maximum stage known, 37.2 ft Mar. 13, 1918, from floodmarks (discharge, about 49,000 cfs).

Mean discharge, in cubic feet per second, 1957

GUYANDOT RIVER BASIN

9. GUYANDOT RIVER AT MAN, W. VA.

Location.—Lat $37^{\circ}44'30''$, long $81^{\circ}52'45''$, on right bank on downstream side of highway bridge at Man, Logan County, 500 ft upstream from Buffalo Creek and 0.7 mile downstream from Huff Creek. Records include flow of Buffalo Creek.

Drainage area,—762 sq mi (including that of Buffalo Creek).

Gage-height record.—Water-stage recorder graph, except for periods of doubtful gage-height record Jan. 31 to Feb. 1 and Feb. 3-14 for which graph was reconstructed from existing recorder record and engineers' readings. Datum of gage is 710.88 ft above mean sea level, adjustment of 1912.

Discharge record.—Stage-discharge relation defined by current meter measurements below 24,000 cfs.

Maxima.—January-February 1957: Discharge, 37,600 cfs 10:30 p.m. Jan. 29 (gage height, 22.25 ft).

1928 to December 1956: Discharge observed, 40,000 cfs Mar 3, 1934 (gage height, 19.11 ft from rating curve extended above 20,000 cfs).

Mean discharge, in cubic feet per second, 1957

10. GUYANDOT RIVER AT BRANCHLAND, W. VA.

Location.—Lat $38^{\circ}13'15''$, long $82^{\circ}12'10''$, on right bank at downstream side of highway bridge at Branchland, Lincoln County, 20 ft downstream from Fourmile Creek.

Drainage area.—1,226 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 547.91 ft above mean sea level, adjustment of 1912.

Discharge record.—Stage-discharge relation defined below 32,000 cfs by current meter measurements. For periods of backwater from the Ohio River Jan. 11-13, Jan. 31 to Feb. 5 and Feb. 10-13, the discharge is computed by the normal fall method between this station and the U.S. Corps of Engineers wire-weight gage at Midkiff, approximately 4 miles upstream.

Maxima.—January—February 1957: Discharge, 40,400 cfs 10:30 p.m. Jan. 30 (gage height, 41.88 ft).

1915-22, 1928 to December 1956: Discharge, 36,900 cfs Jan. 29, 1918 (gage height, 39.24 ft); maximum gage height, 42.57 ft on Mar. 1, 1955 (backwater from the Ohio River).

Maximum stage known, about 44 ft, from floodmark probably in 1907 (discharge, 43,500 cfs).

Mean discharge, in cubic feet per second, 1957

BIG SANDY RIVER BASIN

11. PRATER CREEK AT VANSANT, VA.

[Crest-stage station]

Location.—Lat $37^{\circ}13'05''$, long $82^{\circ}06'10''$, at Virginia Highway 620 bridge just off Virginia Highway 83, 500 ft downstream from Trace Fork, and 1 mile south of Vansant, Buchanan County.

Drainage area.—19.8 sq mi.

Gage-height record.—Crest stages only. Altitude of gage is 1,180 ft (by topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurement at 260 cfs and by contracted-opening measurements at 1,140 and 4,550 cfs.

Maxima.—January 1957: Discharge, 4,550 cfs, Jan. 29 (gage height, 9.45 ft).

1951 to December 1956: Discharge, about 1,500 cfs, April 28, 1952.

12. LEVISA FORK NEAR GRUNDY, VA.

Location.—Lat $37^{\circ}18'$, long $82^{\circ}07'30''$, on left bank 50 ft downstream from wooden bridge to Appalachian Electric Power Co.'s substation, 2 miles northwest of Grundy, Buchanan County, 2.7 miles downstream from Slate Creek, and 2.8 miles upstream from Poplar Creek.

Drainage area.—235 sq mi.

Gage-height record.—Water-stage recorder graph except Feb. 13–17 when faulty intake action occurred. Datum of gage is 986.17 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 6,500 cfs and by a slope-area measurement at 32,800 cfs and a contracted-opening measurement at 34,100 cfs. Discharge for the period Feb. 13–17 estimated on basis of reconstructed trace.

Maxima.—January–February 1957: Discharge, 33,200 cfs 1 p.m. Jan. 29 (gage height, 19.06 ft).

1941 to December 1956: Discharge, 17,400 cfs Jan. 7, 1946 (gage height, 14.5 ft, from graph based on twice daily gage readings).

Flood of March 1929 reached a stage of 16.0 ft (discharge, 21,800 cfs), from information by local residents.

Mean discharge, in cubic feet per second, 1957

13. LEVISA FORK AT FISHTRAP, KY.

Location.—Lat $37^{\circ}25'45''$, long $82^{\circ}23'20''$, on right bank 300 ft south of U.S. Highway 460, 700 ft downstream from Hurricane Creek, 1 mile southeast of Fishtrap, Pike County, and 6.1 miles upstream from Russell Fork.

Drainage area.—386 sq mi.

Gage-height record.—Staff gage read twice daily, except Jan. 20–27, Jan. 30 to Feb. 1, Feb. 3–27; graph drawn Jan. 6, 9–12, 28, 29, and Feb. 2; and Jan. 27, Jan. 30 to Feb. 1, Feb. 3–5 using readings on adjacent days, floodmarks, time of peak, and recorder record for stations near Grundy and at Pikeville as a guide. Datum of gage is 688.10 ft above mean sea level, adjustment of 1912 (levels by Corps of Engineers).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 15,000 cfs and by slope-area measurement at 33,000 cfs. Discharge for Jan. 20–26, Feb. 6–27 estimated on basis of weather records and records for station near Grundy, W. Va.

Maxima.—January–February 1957: Discharge, 33,000 cfs 9:30 p.m. Jan. 29 (gage height, 33.9 ft, from floodmark).

1938 to December 1956: Discharge 23,000 cfs Jan. 7, 1946 (gage height, 22.82 ft, from floodmark), from rating curve extended above 15,000 cfs on basis of slope-area determinations at gage heights 20.26 and 22.82 ft.

Maximum stage known, about 26.5 ft in 1929.

14. RUSSELL FORK AT HAYSI, VA.

Location.—Lat $37^{\circ}12'25''$, long $82^{\circ}17'45''$, on right bank 180 ft downstream from highway bridge at Haysi, Dickenson County, and 700 ft downstream from McClure River.

Drainage area.—286 sq mi.

Gage-height record.—Water-stage recorder graph except Jan. 2-7. Datum of gage is 1,237.96 ft above mean sea level, datum of 1929, supplementary adjustment of 1944.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 12,000 cfs and by slope-area measurements at 46,600 cfs.

Maxima.—January—February 1957: Discharge, 46,600 cfs 2 p.m. Jan. 29 (gage height, 23.17 ft).

1926 to December 1956: Discharge, 34,500 cfs March 23, 1929 (gage height, 18.5 ft, from floodmarks).

15. POTCAMP CREEK NEAR POUND, VA.

[Miscellaneous site]

Location.—Lat $37^{\circ}02'29''$, long $87^{\circ}36'$, at culvert on U.S. Highway 23, 6.0 miles south of Pound, Wise County.

Drainage area.—1.5 sq mi.

Gage-height record.—Floodmarks only. Datum of 1929.

Maximum.—January 1957: Discharge, 292 cfs Jan. 29 (stage, 1,667.22 ft above mean sea level, from floodmarks) from computation of flow through culvert and overflow in ditch.

16. POUND RIVER AT POUND, VA.

[Miscellaneous site]

Location.—Lat $37^{\circ}07'20''$, long $82^{\circ}35'56''$, at Pound, Wise County, half a mile downstream from Indian Creek.

Drainage area.—61 sq mi.

Maximum.—January 1957: Discharge, 15,300 cfs Jan. 29 from slope-area measurement.

17. POUND RIVER NEAR HAYSI, VA.

Location.—Lat $37^{\circ}12'50''$, long $82^{\circ}22'50''$, on left bank 0.2 mile downstream from Cranesnest River, 0.8 mile upstream from Twin Branch, and 4.7 miles west of Haysi, Dickenson County.

Drainage area.—212 sq mi.

Gage-height record.—Water-stage recorder graph.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 11,000 cfs and by slope-area measurement of 27,600 cfs.

Maxima.—January–February 1957: Discharge, 27,300 cfs 5 p.m. Jan. 29 (gage height, 18.65 ft).

1926 to December 1956: Discharge, 30,000 cfs Mar. 23, 1929 (gage height, 16.5 ft, from floodmarks, at site 0.8 mile downstream at different datum).

18. RUSSELL FORK AT ELKHORN CITY, KY.

[Miscellaneous site]

Location.—Lat $37^{\circ}18'20''$, long $82^{\circ}20'55''$, 1,500 ft upstream from bridge on State Highway 80 at Elkhorn City, Pike County, 0.3 mile downstream from Lower Branch, and 0.6 mile upstream from Elkhorn Creek.

Drainage area.—555 sq mi.

Discharge record.—Peak discharge by slope-area measurement.

Maximum.—January–February 1957: Discharge, 51,200 cfs Jan. 29.

19. LEVISA FORK AT PIKEVILLE, KY.

Location.—Lat $37^{\circ}28'35''$, long $82^{\circ}31'05''$, on left bank at foot of Huffman Avenue in Pikeville, Pike County, one-quarter of a mile upstream from bridge on U.S. Highway 119, 0.5 mile upstream from Ferguson Fork, and 7.6 miles downstream from Shelby Creek.

Drainage area.—1,237 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 633.18 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 45,000 cfs and by slope-area measurement at 85,500 cfs.

Maxima.—January–February 1957: Discharge, 85,500 cfs 12:30 a.m. Jan. 30 (gage height, 52.72 ft).

1937 to December 1956: Discharge, 50,300 cfs Jan. 8, 1946 (gage height, 42.90 ft).

Maximum stage known, about 52 ft in February 1862. Flood of January 1918 reached a stage of 44.7 ft, from floodmark.

Mean discharge in cubic feet per second, 1957

20. LEVISA FORK AT PRESTONSBURG, KY.

[Miscellaneous site]

Location.—Lat $37^{\circ}39'50''$, long $82^{\circ}46'08''$, on right bank at water plant in Prestonsburg, Floyd County, 900 ft upstream from Town Brook, and 1,300 ft upstream from highway bridge.

Drainage area.—1,700 sq mi, approximately.

Gage-height record.—Staff gage. Datum of gage is 588.12 ft above mean sea level, datum of 1929.

Discharge record.—Peak discharge by extension of rating curve above 63,000 cfs.

Maximum.—January–February 1957: Discharge, 69,700 cfs 5 p.m. Jan. 30 (gage height, 48.78 ft, from floodmark).

FLOODS OF 1957

21. JOHNS CREEK NEAR META, KY.

Location.—Lat $37^{\circ}33'50''$, long $82^{\circ}27'20''$, on left bank 100 ft upstream from Ford Branch, 1,000 ft upstream from U.S. Highway 119 bridge, 1.0 mile upstream from Raccoon Creek, and 1.1 miles southwest of Meta, Pike County.

Drainage area.—55.7 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 717.66 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 1,900 cfs and by contracted-opening measurement of 4,680 cfs.

Maxima.—January-February 1957: Discharge, 4,680 cfs 3 p.m. Jan. 29 (gage height, 14.54 ft).

1941 to December 1956: Discharge, 4,480 cfs Feb. 27, 1955 (gage height, 14.28 ft). Flood in 1939 reached a stage of 13.6 ft, from floodmarks 600 ft downstream.

22. DEWEY RESERVOIR NEAR VAN LEAR, KY.

Location—Lat $37^{\circ}44'16''$, long $82^{\circ}43'50''$, in intake structure of Dewey Dam on Johns Creek, 1.0 mile upstream from Daniels Creek and $2\frac{1}{2}$ miles southeast of Van Lear, Johnson County.

Drainage area.—207 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage at mean-sea level (levels by Corps of Engineers).

Maxima.—January–February 1957: Contents, 49,270 acre-feet 4 p.m. Feb. 3 (elevation, 670.03 ft.).

1950 to December 1956: Contents, 81,400 acre-feet Mar. 9, 1955 (elevation, 682.30 ft.).

Remarks.—Reservoir is formed by rolled earth-fill dam with discharge tunnel, controlled by concrete gravity weir, crest elevation, 644.5 ft, 3 gated sluices, and uncontrolled side channel concrete spillway. Dam completed July 22, 1949 and filling of pool began May 15, 1950. Conservation pool (elevation, 645.0 ft) first reached June 14, 1950. Total capacity at elevation 686.0 ft (spillway crest) is 93,300 acre-feet, of which 81,000 acre-feet above elevation 645.0 ft is reversed for flood control and 12,300 acre-feet below elevation 645.0 ft is for conservation. Figures given herein represent total contents, of which 69 acre-feet below gate sill, elevation, 608.25 ft, is dead storage. Gage-height record and contents furnished by Corps of Engineers.

Elevation, in feet, and contents, in acre-feet at 12 p.m. of indicated day, 1957

Supplemental record.—Dec. 31, 1956, 12 p.m., 645.32 ft, 12,560 acre-feet.

23. JOHNS CREEK NEAR VAN LEAR, KY.

Location.—Lat $37^{\circ}44'37''$, long $82^{\circ}43'27''$, on right bank 100 ft upstream from Long Branch, 0.3 mile upstream from Daniels Creek, 0.5 mile downstream from Dewey Dam, and $2\frac{1}{2}$ miles southeast of Van Lear, Johnson County.

Drainage area.—208 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 597.28 ft above mean sea level (levels by Corps of Engineers).

Discharge record.—Stage-discharge relation defined by current-meter measurements. Backwater from Levisa Fork, Jan. 29 to Feb. 3, Feb. 10-12; discharge computed on basis of releases from Dewey Reservoir.

Maxima.—January to February 1957: Discharge, 3,150 cfs 11 a.m. Feb. 14 (gage height, 14.96 ft); gage height, 27.88 ft 11 p.m. Jan. 30 (backwater from Levisa Fork).

1939 to December 1956: Discharge, 8,350 cfs Jan. 9, 1946 (gage height, 26.50 ft, from rating curve extended above 3,100 cfs by logarithmic plotting).

Remarks.—Flow regulated by Dewey Reservoir (capacity, 93,300 acre-feet).

Mean discharge, in cubic feet per second, 1957

24. PAINT CREEK AT STAFFORDSVILLE, KY.

Location.—Lat $37^{\circ}50'05''$, long $82^{\circ}52'15''$, near center of span on downstream side of bridge on U.S. Highway 460, 100 ft downstream from Barnetts Creek, 0.8 mile upstream from Mudlick Creek, 1.7 miles west of Staffordsville, Johnson County, 4 miles upstream from Jenny Creek, and 7.6 miles upstream from mouth.

Drainage area.—101 sq mi.

Gage-height record.—Wire-weight gage read twice daily and peak from crest-stage indicator. Graph drawn for days of changing stage. Datum of gage is 600.96 ft above mean sea level, datum of 1929, supplementary adjustment of 1944.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 4,150 cfs 5 p.m. Jan. 29 (gage height, 16.50 ft, from crest-stage indicator).

1950 to December 1956: Discharge, 11,700 cfs Sept. 20, 1950, Mar. 22, 1952, from rating curve extended above 5,500 cfs by logarithmic plotting; gage height, 24.11 ft Mar. 22, 1952.

The flood of July 5, 1939, reached a stage of about 25 ft, from information by local residents.

25. LEVISA FORK AT PAINTSVILLE, KY.

Location.—Lat $37^{\circ}48'55''$, long $82^{\circ}47'30''$, on left bank 400 ft downstream from bridge on State Highway 40 at Paintsville, Johnson County, and 1,100 ft downstream from Paint Creek.

Drainage area.—2,143 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 566.84 ft above mean sea level, datum of 1929, supplementary adjustment of 1944.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 69,700 cfs 5 a.m. Jan. 31 (gage height, 45.92 ft).

1915–16, 1928 to December 1956: Discharge, 62,300 cfs Feb. 4, 1939 (gage height, 42.15 ft, observed at crest).

Flood of Jan. 29, 1918, reached a gage height of 42.0 ft, determined by Corps of Engineers from floodmarks at site and datum then in use. Flood of 1862 reached a stage of 46.6 ft, from levels to floodmark by Corps of Engineers.

Remarks.—Slight regulation by Dewey Reservoir (capacity 93,300 acre ft).

26. TUG FORK AT LITWAR, W. VA.

Location.—Lat $37^{\circ}29'05''$, long $81^{\circ}50'40''$, on left bank 200 ft downstream from War Branch, 0.5 mile downstream from Litwar, McDowell County, 2.2 miles northwest of Laeger, and 2.7 miles downstream from Dry Fork.

Drainage area,—502 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 936.36 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current meter measurements below 30,000 cfs and extended above. Stage-discharge relation affected by ice Jan. 17–21.

Maxima.—January–February 1957: Discharge, 35,700 cfs 7:30 p.m. Jan. 29 (gage height, 21.60 ft).

1930 to December 1956: Discharge, 27,600 cfs Mar. 25, 1935 (gage height, 19.0 ft).

Mean discharge, in cubic feet per second, 1957

27. PANTHER CREEK NEAR PANTHER, W. VA.

Location.—Lat $37^{\circ}26'45''$, long $81^{\circ}52'15''$, on left bank, 200 ft downstream from Cub Branch, 2.1 miles upstream from Trace Fork and 3 miles southwest of Panther, McDowell County.

Drainage area.—30.8 sq mi.

Gage-height record.—Water-stage recorder graph. Altitude of gage is 1,050 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current meter measurements below 2,800 cfs and extended above. Stage-discharge relation affected by ice, Jan. 18–21.

Maxima.—January–February 1957: Discharge, 4,900 cfs 11:30 a.m. Jan. 29 (gage height, 9.50 ft).

1946 to December 1956: Discharge, 4,200 cfs Mar. 6, 1955 (gage height, 8.98 ft).

28. TUG FORK NEAR KERMIT, W. VA.

Location.—Lat $37^{\circ}49'05''$, long $82^{\circ}23'20''$, on right bank 2 miles upstream from Wolf Creek, 3 miles upstream from Kermit, Mingo County, and 3 miles downstream from Pigeon Creek.

Drainage area.—1,185 sq mi.

Gage-height record.—Water-stage recorder graph except 2 a.m. to 4 p.m. Jan. 30 for which graph was reconstructed on the basis of high-water mark. Datum of gage is 581.82 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current meter measurements below 30,000 cfs and by slope-area measurement of 61,600 cfs.

Maxima.—January-February 1957: Discharge, 61,300 cfs 1 p.m. Jan. 30 (gage height, 43.88 ft, high water mark in gage well).

1934 to December 1956: Discharge, 44,600 cfs Feb. 28, 1955 (gage height, 40.6 ft).

Stage previously known: About 43.3 ft on unknown date prior to 1915.

29. BIG SANDY RIVER AT LOUISA, KY.

Location.—Lat $38^{\circ}10'16''$, long $82^{\circ}38'05''$, on left bank, 1.6 miles upstream from Blaine Creek, 4.3 miles northwest of Louisa, Lawrence County, and at mile 21.2.

Drainage area.—3,870 sq mi, approximately.

Gage-height record.—Water-stage recorder graphs, except for Feb. 9, 10 at auxiliary gage, 5.0 miles upstream. Datum of gage is 512.81 ft above mean sea level, datum of 1929.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor Jan. 12, 13, Jan. 24–28, Jan. 30 to Feb. 8, Feb. 11–15. Discharge for Feb. 9, 10 estimated on basis of recorded range in stage, weather records and summation of records for Levisa Fork at Paintsville, Ky., and Tug Fork near Kermit, W. Va.

Maxima.—January–February 1957: Discharge, 84,900 cfs 6 p.m. Jan. 31 (gage height, 44.42 ft); gage height, 44.43 ft at 7 p.m. Jan. 31.

1938 to December 1956: Discharge, 89,400 cfs Mar. 2, 1955; gage height, 46.36 ft Mar. 2, 1955.

Flood of Apr. 3, 1908, reached a stage of 48.4 ft, former site and datum.

30. BLAINE CREEK AT YATESVILLE, KY.

Location.—Lat $38^{\circ}08'40''$, long $82^{\circ}41'05''$, on upstream wall near center of span of covered bridge at Yatesville, Lawrence County, 5 miles northwest of Louisa, 5.8 miles upstream from Cat Creek, and 10.2 miles downstream from Little Blaine Creek.

Drainage area.—217 sq mi.

Gage-height record.—Wire-weight gage and peak from crest-stage indicator. Graph drawn for days of changing stage. Datum of gage is 561.57 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima,—January-February 1957: Discharge, 4,320 cfs 7-8 a.m. Jan. 30 (gage height, 16.05 ft, from crest-stage indicator).

1915-18, 1938 to December 1956: Discharge, 15,500 cfs Feb. 4, 1939 (gage height, 26.55 ft).

Maximum stage known, 27.6 ft, on unknown date prior to 1915.

Mean discharge, in cubic feet per second, 1957

LITTLE SANDY RIVER BASIN

31 LITTLE SANDY RIVER NEAR GRAYSON, KY

Location.—Lat $38^{\circ}20'25''$, long $82^{\circ}55'10''$, on downstream side of center pier of highway bridge, 0.3 mile upstream from Lower Stinson Creek, 1.3 miles downstream from U.S. Highway 60, and 1.7 miles northeast of Grayson, Carter County.

Drainage area.—398 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 557.95 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima,—January-February 1957: Discharge, 6,400 cfs 10 p.m. Jan. 23 (gage height, 17.09 ft).

1938 to December 1956: Discharge, 24,500 cfs Sept. 22, 1950; gage height, 27.53 ft Sept. 22, 1950.

Mean discharge, in cubic feet per second, 1957

TYGARTS CREEK BASIN

32. TYGARTS CREEK NEAR GREENUP, KY

Location.—Lat 38°33'51", long 82°57'08", on downstream side of center pier of bridge on State Highway 7, 100 ft downstream from Lick Run, 0.4 mile upstream from White Oak Creek, and $\frac{1}{2}$ miles west of Greenup, Greenup County.

Drainage area.—241 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 547.14 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January-February 1957: Discharge, 4,000 cfs 11:30 p.m. Jan. 23 (gage height,

3.99 ft). The total length of the bridge is 100.00 m.

LICKING RIVER BASIN

33. LICKING RIVER NEAR SALYERSVILLE, KY

Location.—Lat $37^{\circ}45'03''$, long $83^{\circ}05'04''$, on left bank at upstream side of bridge on State Highway 30, 0.2 mile upstream from Gardner Branch, 1.2 miles west of Salyersville, Magoffin County, and 3.1 miles downstream from State Road Fork.

Drainage area.—140 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 823.80 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 5,880 cfs 12:30 a.m. Jan. 30 (gage height, 20.79 ft).

1938 to December 1956: Discharge, 14,300 cfs Feb. 3, 1939 (gage height, 25.4 ft, from floodmark).

KENTUCKY RIVER BASIN

34. NORTH FORK KENTUCKY RIVER AT WHITESBURG, KY

[Miscellaneous site]

Location.—Lat $37^{\circ}07'12''$, long $82^{\circ}49'50''$, at first railroad bridge downstream from railroad station in Whitesburg, Letcher County, 0.7 mile downstream from bridge on U.S. Highway 119, and 1.3 miles downstream from Solomon Branch.

Drainage area.—66.4 sq mi.

Discharge record.—Peak discharge by contracted-opening measurement.

Maximum.—January-February 1957: Discharge, 7,730 cfs Jan. 29.

FLOODS OF 1957

35. NORTH FORK KENTUCKY RIVER AT HAZARD, KY.

Location.—Lat $37^{\circ}14'45''$, long $83^{\circ}11'00''$, near right bank on downstream side of Woodland Park bridge on eastern limits of Hazard, Perry County, 150 ft upstream from city waterworks dam, and 4.0 miles upstream from Lotts Creek.

Drainage area.—466 sq mi.

Gage-height record.—Wire-weight gage read twice daily and peak from floodmarks.

Graph drawn for days of changing stage. Datum of gage is 839.76 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 20,000 cfs and by contracted-opening measurement at 47,800 cfs.

Maxima.—January–February 1957: Discharge, 47,800 cfs 7 p.m. Jan. 29 (gage height, 37.54, from floodmarks).

1940 to December 1956: Discharge, 28,100 cfs Feb. 1, 1951 (gage height, 27.2 ft).

Flood of May 30, 1927, reached a stage of about 34 ft (from information by local resident, U.S. Weather Bureau gage reading and relation of 1927 and 1939 floods). Flood of Feb. 3, 1939, reached a stage of 29.95 ft, from floodmark.

Mean discharge, in cubic feet per second, 1957

36. BEAR BRANCH NEAR NOBLE, KY.

Location.—Lat $37^{\circ}27'02''$, long $83^{\circ}11'43''$, on right bank 800 ft upstream from mouth, a quarter of a mile west of Noble, Breathitt County, 1.4 miles east of former site of Noble Postoffice, and $3\frac{1}{2}$ miles north of Stacy.

Drainage area.—2.21 sq mi.

Gage-height record.—Water-stage recorder graph, except for periods of lagging intake action, Jan. 10–14, 23–26, 29–31, Feb. 2, 3, 10–14, when graph was drawn using shape of recorder trace, occasional staff-gage readings, and floodmark. Datum of gage is 807.81 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 150 cfs.

Maxima.—January–February 1957: Discharge, 375 cfs 9 a.m. Jan. 29 (gage height, 3.20 ft, from floodmark).

1954 to December 1956: Discharge, 328 cfs Feb. 18, 1956 (gage height, 3.01 ft).

FLOODS OF 1957

38. NORTH FORK KENTUCKY RIVER AT JACKSON, KY.

Location.—Lat 37°33'05", long 83°23'05", near center of span on upstream side of bridge on State Highways 30 and 52 at Jackson, Breathitt County, 3 miles downstream from Quicksand Creek.

Drainage area,—1,101 sq mi.

Gage-height record.—Graph drawn from twice-daily wire-weight gage readings, except Jan. 29 to Feb. 1, when graph was based on numerous extra readings and observations at crest. Datum of gage is 697.67 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Rate of change in stage used as a factor Jan. 9–11, 23, 24, Jan. 28 to Feb. 4, Feb. 8–12.

Maxima.—January–February 1957: Discharge, 53,500 cfs 10 a.m. Jan. 30 (gage height, 39.34 ft); gage height, 40.41 ft 3:15 p.m. Jan. 30.

1928–31, 1936–37, 1938 to December 1956: Discharge, 46,800 cfs Feb. 4, 1939, (gage height, 43.10 ft).

Maximum stage known, that of Feb. 4, 1939. Flood of May 30, 1927, reached a stage of 42.9 ft.

Mean discharge, in cubic feet per second, 1957

39. NORTH FORK KENTUCKY RIVER NEAR AIREDALE, KY.

[Gaging station, discontinued 1942]

Location (revised).—Lat $37^{\circ}36'25''$, long $83^{\circ}37'50''$, on right bank 0.3 mile downstream from Laurel Branch, half a mile northeast of Airedale, Lee County, 3.8 miles upstream from confluence with Middle Fork, and 5 miles northeast of Beattyville. Drainage area.—1,294 sq mi (revised).

Gage-height record.—Floodmark only. Datum of gage is 632.29 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 22,000 cfs made in 1929–31, 1940–42.

Maxima.—January–February 1957: Discharge, about 55,000 cfs Jan. 30, 1957 (gage height, 47.14 ft, from floodmark).

1929–31, 1939–42: Discharge, 24,200 cfs July 10, 1942 (gage height, 28.30 ft).

Flood of Feb. 4, 1939, reached a stage of 45.6 ft, from data furnished by Corps of Engineers.

40. MIDDLE FORK KENTUCKY RIVER NEAR HYDEN, KY.

[Miscellaneous site]

Location.—Lat $37^{\circ}10'45''$, long $83^{\circ}22'20''$, 0.8 mile downstream from Owlsnest Branch and 1.2 miles north of Hyden, Leslie County.

Drainage area.—226 sq mi.

Discharge record.—Peak discharge by slope-area measurement.

Maximum.—January–February 1957: Discharge, 67,500 cfs Jan. 29.

FLOODS OF 1957

41. MIDDLE FORK KENTUCKY RIVER AT BUCKHORN, KY.

Location.—Lat $37^{\circ}20'45''$, long $83^{\circ}28'07''$, on right bank 25 ft upstream from Squabble Creek, 250 ft upstream from suspension highway bridge on county road, at Buckhorn, Perry County, about 2,000 ft downstream from flood control dam, and at mile 42.9. Drainage area,—420 sq mi.

Gage-height record.—Water-stage recorder graph except for periods 12 m. Jan. 29 to 3 p.m. Jan. 31 and Feb. 5–28. Graph for first period was drawn on basis of floodmark, time of peak, and shape of recorder graph on adjacent days, and for Feb. 5 on basis of recorder graph for station at Tallega. Datum of gage is 717.52 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurement below 15,000 cfs and by slope-area measurement at 82,300 cfs. Discharge for Feb. 6–28 estimated on basis of weather records and records for station at Tallega.

Maxima.—January–February 1957: Discharge 82,300 cfs 8:30 p.m. Jan. 29 (gage height, 43.1 ft from floodmark).

Flood of January 1939 reached a stage of 38.1 ft, from levels to high-water mark by Corps of Engineers.

Remarks.—Station established Sept. 12, 1956.

42. MIDDLE FORK KENTUCKY RIVER AT TALLEGA, KY.

Location.—Lat $37^{\circ}33'18''$, long $83^{\circ}35'38''$, on downstream side of left pier of highway bridge, 100 ft upstream from Lynam Creek, 0.5 mile southwest of Tallega, Lee County, and 7.9 miles upstream from confluence with North Fork.

Drainage area.—537 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 642.13 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 15,000 cfs and by contracted-opening measurement at 52,700 cfs.

Maxima.—January–February 1957: Discharge, 52,700 cfs 11 a.m. Jan. 30 (gage height, 43.33 ft).

1930–32, 1939 to December 1956: Discharge, 35,300 cfs Feb. 2, 1951 (gage height, 40.07 ft).

Flood of February 1939 reached a stage of 40.5 from information by Corps of Engineers.

43. RED BIRD RIVER NEAR BIG CREEK, KY.

[Miscellaneous site]

Location.—Lat $37^{\circ}09'10''$, long $83^{\circ}35'10''$, 700 ft upstream from Elk Creek, 0.4 mile upstream from bridge on U.S. Highway 421, and 1.1 miles southwest of Big Creek, Clay County.

Drainage area.—117 sq mi.

Discharge record.—Peak discharge by slope-area measurement.

Maximum.—January-February 1957: Discharge, 48,500 cfs Jan. 29.

44. GOOSE CREEK AT MANCHESTER, KY.

[Miscellaneous site]

Location.—Lat $37^{\circ}09'$, long $83^{\circ}45'40''$, 600 ft upstream from Louisville and Nashville Railroad station at Manchester, Clay County, and 1.1 miles upstream from Little Goose Creek.

Drainage area.—163 sq mi.

Discharge record.—Peak discharge by slope-area measurement.

Maximum.—January-February 1957: Discharge, 29,800 cfs Jan. 29.

45. SOUTH FORK KENTUCKY RIVER NEAR ONEIDA, KY.

[Miscellaneous site]

Location.—Lat $37^{\circ}20'45''$, long $83^{\circ}41'$, 0.8 mile downstream from Road Run Branch, 1.0 mile upstream from Sexton Creek, and 5.5 miles northwest of Oneida, Clay County.

Drainage area.—549 sq mi.

Discharge record.—Peak discharge from slope-area measurement.

Maximum.—January-February 1957: Discharge, 58,200 cfs Jan. 29.

46. SOUTH FORK KENTUCKY RIVER AT BOONEVILLE, KY.

Location.—Lat $37^{\circ}28'45''$, long $83^{\circ}40'38''$, on right bank 600 ft downstream from Buck Creek, 900 ft downstream from bridge on State Highway 30 at Booneville, Owsley County, and 0.5 mile downstream from Meadow Creek.

Drainage area.—722 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage 642.49 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 35,000 cfs and by slope-area measurement at 60,100 cfs. Rate of change in stage is a factor Jan. 9-11, 23-24, Jan. 28 to Feb. 3, Feb. 9-12.

Maxima.—January-February 1957: Discharge, 66,100 cfs 4 a.m. Jan. 30 (gage height, 42.50 ft); gage height, 43.40 ft 9 a.m. Jan. 30.

1925-31, 1939 to December 1956: Discharge, 50,700 cfs June 29, 1947 (gage height, 41.70 ft).

47. KENTUCKY RIVER AT LOCK 14, AT HEIDELBERG, KY.

Location.—Lat $37^{\circ}33'19''$, long $83^{\circ}46'06''$, on right bank 1,000 ft upstream from lock 14 at Heidelberg, Lee County, 0.5 mile upstream from Sturgeon Creek, and at mile 249.2. Drainage area.—2,657 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage 626.66 ft above mean sea level, Ohio River datum (Corps of Engineers benchmark).

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January-February 1957: Discharge, 116,000 cfs 10 p.m. Jan. 30 (gage height, 35.00 ft).

1925-31, 1936-37, 1938 to December 1956: Discharge, 120,000 cfs Feb. 4, 1939 (gage height, 35.6 ft, from floodmarks).

48. RED RIVER NEAR HAZEL GREEN, KY.

Location.—Lat $37^{\circ}48'44''$, long $83^{\circ}27'50''$, on right bank 600 ft upstream from Buck Creek, 0.3 mile downstream from Chapel Branch, and 2.7 miles northwest of Hazel Green, Wolfe County.

Drainage area.—65.8 sq mi.

Gage-height record.—Water-stage recorder graph. Altitude of gage is 880 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 2,110 cfs 8:15 p.m. Jan. 29 (gage height, 7.43 ft).

1954 to December 1956: Discharge, 3,020 cfs Feb. 28, 1955 (gage height, 10.64 ft).

49. STILLWATER CREEK AT STILLWATER, KY.

Location.—Lat $37^{\circ}45'24''$, long $83^{\circ}29'12''$, on right bank 15 ft downstream from bridge on Highway 15 at Stillwater, Wolfe County, 90 ft downstream from Trace Fork, and 2.1 upstream from Laurel Fork.

Drainage area.—24.0 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 883.83 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 1,500 cfs and by slope-area measurement at 2,960 cfs.

Maxima.—January-February 1957: Discharge, 1,510 cfs 10:30 a.m. Jan. 29 (gage height, 8.36 ft).

1954 to December 1956: Discharge, 3,890 cfs Dec. 14, 1956 (gage height, 12.91 ft).

50. RED RIVER AT CLAY CITY, KY.

Location.—Lat $37^{\circ}51'52''$, long $83^{\circ}55'59''$, on downstream side of pier on left bank at bridge on State Highway 15 at Waltersville, 500 ft upstream from Brush Creek, half a mile west of Clay City, Powell County, and 4.8 miles upstream from Hardwick Creek.

Drainage area.—362 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 600.47 ft above mean sea level, datum of 1929 (levels by Corps of Engineers).

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Rate of change in stage used as a factor, Jan. 9-12, 22-25, Jan. 28 to Feb. 4, Feb. 8-12.

Maxima.—January-February 1957: Discharge, 9,110 cfs 11 a.m. Jan. 30 (gage height, 17.38 ft); gage height, 17.49 ft 2 p.m. Jan. 30.

1930-32, 1938 to December 1956: Discharge, 21,100 cfs July 15, 1938 (gage height, 22.8 ft).

51. KENTUCKY RIVER AT LOCK 10, NEAR WINCHESTER, KY.

Location.—Lat $37^{\circ}53'41''$, long $84^{\circ}15'44''$, on left bank at lock 10, 0.9 mile downstream from Otter Creek, 8 miles southwest of Winchester, Clark County, and at mile 176.4. Drainage area.—3,955 sq mi.

Gage-height record.—Graph drawn from twice-daily upper staff gage readings and floodmarks at lock 10, except Feb. 2-5 when estimates of gage height by observer were used. Graph drawn for auxiliary gage, 18.9 miles downstream, from twice-daily readings. Datum of gage is 557.37 ft above mean sea level, Ohio River datum.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor 12 m. Jan. 31 to 6 p.m. Feb. 4.

Maxima.—January-February 1957: Discharge, 85,400 cfs 9 p.m., Feb. 1 (gage height, 33.60 ft); gage height, 33.65 ft 12 p.m. Feb. 1 (from floodmarks).

1907 to December 1956: Discharge, 92,400 cfs Feb. 5, 1939; gage height, 35.1 ft Mar. 29, 1913.

Remarks.—Gage-height readings furnished by Corps of Engineers.

52. KENTUCKY RIVER AT LOCK 8, NEAR CAMP NELSON, KY.

Location.—Lat $37^{\circ}44'43''$, long $84^{\circ}35'12''$, on wall of lock 8 near right bank, 2.4 miles southeast of Camp Nelson, Jessamine County, 2.7 miles downstream from Sugar Creek, 4.5 miles upstream from Hickman Creek, and at mile 139.9.

Drainage area.—4,414 sq mi.

Gage-height record.—Graph drawn from twice-daily upper staff gage readings, except Feb. 2 when numerous readings were made near crest. Water-stage recorder graph for auxiliary gage 4.8 miles downstream. Datum of gage is 520.50 ft above mean sea level, datum of 1929 (levels by Corps of Engineers).

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Fall used as factor 12 p.m. Jan. 29 to 12 m. Feb. 5, Feb. 10.

Maxima.—January-February 1957: Discharge, 89,700 cfs 2 p.m. Feb. 2 (gage height, 38.52 ft).

1939 to December 1956: Discharge, 85,400 cfs Feb. 17, 1948 (gage height, 37.6 ft).

Flood of Mar. 28, 1913, reached a stage of 40.0 ft (discharge 103,000 cfs). Flood of Jan. 23, 1937, reached a stage of 41.2 ft (discharge, 91,500 cfs). Flood of Feb. 6, 1939, reached a stage of 38.6 ft (discharge, 94,800 cfs).

Remarks.—Gage-height record furnished by Corps of Engineers.

53. DIX RIVER NEAR DANVILLE, KY.

Location.—Lat $37^{\circ}38'31''$, long $84^{\circ}39'39''$, on right bank 50 ft downstream from bridge on State Highway 52, 1.4 miles downstream from Hanging Fork, and 6 miles east of Danville, Boyle County.

Drainage area.—318 sq mi.

Gage-height record.—Water-stage recorder graph. Graph drawn for auxiliary staff gage 2 miles downstream, from twice-daily readings. Altitude of gage is 750 ft (from topographic map).

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor Feb. 11 to 14.

Maxima,—January–February 1957: Discharge, 10,300 cfs 3:30 p.m. Jan. 29 (gage height, 9.97 ft).

1942 to December 1956: Discharge, 20,900 cfs Mar. 5, 1945 (gage height, 16.28 ft).

54. HERRINGTON LAKE NEAR BURGIN, KY.

Location.—Lat $37^{\circ}47'08''$, long $84^{\circ}42'14''$, at Dix Dam on Dix River, 2.9 miles upstream from mouth and 8 miles east of Burgin, Mercer County.

Drainage area.—439 sq mi.

Gage-height record.—Indicator gage read hourly. Datum of gage is at mean sea level (levels by Kentucky Utilities Co.).

Maxima,—January–February 1957: Contents, 106,300 acre-feet 12 p.m. Feb. 11 (elevation, 754.7 ft).

1925 to December 1956: Contents, 123,200 acre-feet, many times (elevation, 760.0 ft).

Remarks.—Reservoir is formed by earth and rock-fill dam with side channel spillway controlled by 10 vertical lift gates 35 ft long and 10 to 12 ft high. Storage began Nov. 4, 1925; water in reservoir first reached minimum pool elevation Nov. 26, 1925. Total usable capacity between elevations 760 ft (top of spillway gates) and 680 ft (minimum pool, dead storage unknown) is 123,200 acre-feet. Reservoir is used for power. Gage-height record furnished by Kentucky Utilities Co.

Supplemental record.—Dec. 31, 1956, 12 p.m., 723.8 ft, 51,500 acre-feet.

55. KENTUCKY RIVER AT LOCK 6, NEAR SALVISA, KY.

Location.—Lat $37^{\circ}55'32''$, long $84^{\circ}49'17''$, on right bank at lock 6, Woodford County, 1.6 miles upstream from Clear Creek, 2.1 miles east of Salvisa, and at mile 96.2.

Drainage area.—5,102 sq mi.

Gage-height record.—Water-stage recorder graph. Graph drawn for auxiliary staff gage, 14 miles downstream, from twice daily readings. Datum of gage is 487.89 ft above mean sea level, unadjusted (Corps of Engineers' benchmark).

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor Jan. 30 to Feb. 5, Feb. 10-13.

Maxima,—January–February 1957: Discharge, 88,700 cfs 5 a.m. Feb. 3 (gage height, 33.91 ft).

1925 to December 1956: Discharge, 112,000 cfs Jan. 23, 1937; gage height, 43.35 ft Jan. 25, 1937 (from floodmarks).

Remarks,—Auxiliary gage-height readings furnished by Corps of Engineers. Flow regulated by Herrington Lake (see station 54) and by hydroelectric plant at lock 7.

56. KENTUCKY RIVER AT LOCK 4, AT FRANKFORT, KY.

Location.—Lat 38°12'06", long 84°52'54", on left bank at downstream side of Broadway Street Bridge at Frankfort, Franklin County, 300 ft upstream from Benson Creek, 0.9 mile upstream from lock 4, and at mile 65.9. Records include flow of Benson Creek.

Drainage area.—5,412 sq mi, includes that of Benson Creek.

Gage-height record.—Water-stage recorder graph. Graph drawn for auxiliary staff gage, 16.3 miles upstream, from twice-daily readings. Datum of gage is 462.10 ft above mean sea level, datum of 1929.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor Jan. 12, 13, 24–26, Feb. 1–6, 10–14.

Maxima.—January–February 1957: Discharge, 84,200 cfs 2 p.m. Feb. 3 (gage height, 35.35 ft); gage height, 35.46 ft 7:30 p.m. Feb. 3.

1925 to December 1956: Discharge, 115,000 cfs Jan. 25, 1937; gage height, 47.46 ft Jan. 25, 1937, from floodmarks, at site 0.9 mile downstream.

Remarks.—Auxiliary gage-height readings furnished by Corps of Engineers. Flow regulated by Herrington Lake (see station 53) and by hydroelectric plant at lock 7.

Mean discharge, in cubic feet per second, 1957

57. KENTUCKY RIVER AT LOCK 2, AT LOCKPORT, KY.

Location.—Lat $38^{\circ}26'20''$, long $84^{\circ}57'48''$, on left bank at lock 2 at Lockport, Henry County, 0.1 mile downstream from Sixmile Creek, and at mile 31.0.

Drainage area.—6,180 sq mi.

Gage-height record.—Graph drawn from twice-daily upper staff gage readings, except Feb. 4 when several readings were made. Graph drawn for auxiliary staff gage, 11.0 miles upstream, from twice-daily readings. Datum of gage 433.36 ft above mean sea level, datum of 1929.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements below 100,000 cfs. Fall used as a factor Jan. 10-14, 24-27, Jan. 30 to Feb. 17.

Maxima,—January-February 1957: Discharge, 86,300 cfs 11 a.m. Feb. 4 (gage height, 40.18 ft); gage height, 40.20 ft 11:30 a.m. to 5 p.m. Feb. 4.

1925 to December 1956: Discharge, 123,000 cfs Jan. 26, 1937; gage height, 56.85 ft Jan. 24, 1937 (backwater from Ohio River).

Remarks.—Gage-height record furnished by Corps of Engineers. Flow regulated by Herrington Lake (see station 53) and hydroelectric plant at lock 7.

Mean discharge, in cubic feet per second, 1957

SALT RIVER BASIN

58. SALT RIVER NEAR HARRODSBURG, KY.

Location.—Lat $37^{\circ}45'26''$, long $84^{\circ}52'23''$, near center of span on downstream side of bridge on State Highway 152, $1\frac{1}{2}$ miles west of Harrodsburg, Mercer County, and 11 miles downstream from Quirks Run.

Drainage area.—41.4 sq mi.

Gage-height record.—Graph drawn from twice-daily wire-weight gage readings. Datum of gage is 810.60 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,500 cfs.

Maxima,—January-February 1957: Discharge, 2,420 cfs 4 a.m. Feb. 10 (gage height 10.8 ft).

1952 to December 1956: Discharge, 4,140 cfs July 24, 1956 (gage height, 15.0 ft).

Remarks.—Some diversion and regulation above station by City of Harrodsburg for municipal water supply.

FLOODS OF 1957

59. SALT RIVER NEAR VAN BUREN, KY.

Location.—Lat $37^{\circ}58'06''$, long $85^{\circ}08'03''$, on right bank at downstream side of Goodnight Bridge, 1.8 miles east of Van Buren, Anderson County, and 2.3 miles upstream from Crooked Creek.

Drainage area.—200 sq mi, approximately.

Gage-height record.—Water-stage recorder graph. Datum of gage is 535.38 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 9,000 cfs.

Maxima.—January–February 1957: Discharge, 5,290 cfs 2:30 a.m. Feb. 10 (gage height, 12.41 ft).

1938 to December 1956: Discharge, 14,700 cfs Feb. 13, 1948 (gage height, 19.3 ft, from floodmark).

Maximum stage known, 22.2 ft in 1928. Flood of January 1937 reached a stage of 19.6 ft.

Mean discharge, in cubic feet per second, 1957

60. ROLLING FORK NEAR LEBANON, KY.

Location.—Lat $37^{\circ}21'50''$, long $85^{\circ}19'26''$, on left bank at downstream side of bridge on U.S. Highway 68 and State Highway 55, 2.2 miles downstream from Buckhorn Creek, 5.4 miles southwest of city limits of Lebanon, Marion County, and $14\frac{1}{2}$ miles downstream from confluence of North and South Forks.

Drainage area.—240 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 580.74 ft above sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 14,000 cfs.

Maxima.—January-February 1957: Discharge, 11,000 cfs 6 a.m. Jan. 23 (gage height, 18.39 ft).

1938 to December 1956: Discharge, 26,500 cfs Jan. 1, 1945 (gage height, 22.4 ft).

Maximum stage known, 24.7 ft in 1913, from information by local residents.

Mean discharge, in cubic feet per second, 1957

GREEN RIVER BASIN

61. MCGILLS CREEK NEAR MCKINNEY, KY.

Location.—Lat $37^{\circ}26'40''$, long $84^{\circ}41'55''$, on right bank 0.3 mile upstream from mouth, 3.2 miles northeast of Arabia, and 3.2 miles east of McKinney, Lincoln County.

Drainage area.—2.19 sq mi.

Gage-height record.—Water-stage recorder graph. Altitude of gage is 970 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 200 cfs and by slope-area measurement at 950 cfs.

Maxima.—January-February 1957: Discharge, 176 cfs 6:30 p.m. Jan. 22 (gage height, 2.80 ft).

1951 to December 1956: Discharge, 950 cfs Mar. 22, 1952 (gage height, 5.40 ft).

Mean discharge, in cubic feet per second, 1957

63. GREEN RIVER NEAR MOUNT SALEM, KY.

Location.—Lat $37^{\circ}24'40''$, long $84^{\circ}45'11''$, on left bank 20 ft upstream from bridge on private road, about 300 ft downstream from South Fork, 0.8 mi downstream from gaging station near McKinney, and 2.6 miles east of Mount Salem, Lincoln County. Drainage area.—36.3 sq mi.

Gage-height record.—Water-stage recorder graph. Altitude of gage is 880 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,000 cfs and by slope-area measurement at 11,700 cfs.

Maxima.—January-February 1957: Discharge, 2,900 cfs 8:15 p.m. Jan. 22 (gage height, 7.95 ft).

1953 to December 1956: Discharge, 5,300 cfs Mar. 21, 1955 (gage height, 9.40 ft).

Mean discharge, in cubic feet per second, 1957

Runoff, in inches-----							4.93	4.79

64. GREEN RIVER AT GREENSBURG, KY.

Location.—Lat $37^{\circ}15'13''$, long $85^{\circ}30'11''$, on left bank 75 ft downstream from bridge on U.S. Highway 68, 300 ft upstream from Clover Lick Creek, a quarter of a mile south of Greensburg, Green County, and 2.6 miles upstream from Russell Creek.

Drainage area.—742 sq mi.

Gage-height record.—Water-stage recorder graph. Graph drawn for auxiliary wire-weight gage, 1.8 miles upstream, from twice-daily readings. Datum of gage is 531.81 ft above mean sea level, datum of 1929.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor Jan. 10-14, Jan. 23 to Feb. 28.

Maxima.—January-February 1957: Discharge, 21,500 cfs 10 p.m. Jan. 30 (gage height, 25.63 ft); gage height, 25.65 ft 8-9 p.m. Jan. 30.

1939 to December 1956: Discharge, 47,000 cfs Mar. 23, 1952 (gage height, 33.50 ft). Maximum stage known, 36.2 ft in 1913, from floodmark.

Mean discharge, in cubic feet per second, 1957

Day	January	February	Day	January	February	Day	January	February

65. RUSSELL CREEK NEAR COLUMBIA, KY.

Location.—Lat $37^{\circ}07'09''$, long $85^{\circ}23'38''$, on left bank of downstream side of bridge on State Highway 61, 0.2 mile upstream from Butlers Fork and 5 miles west of Columbia, Adair County. Records include flow of Butlers Fork.

Drainage area.—186 sq mi, includes that of Butlers Fork.

Gage-height record.—Water-stage recorder graph. Datum of gage is 610.96 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 7,900 cfs, and extended above by logarithmic plotting.

Maxima.—January–February 1957: Discharge, 7,790 cfs 9 p.m. Jan. 29 (gage height, 17.28 ft).

1939 to December 1956: Discharge, 15,900 cfs Mar. 22, 1952 (gage height, 23.8 ft, from floodmark).

Flood of January 1937 reached a stage of about 23 ft, from information by local residents.

Mean discharge, in cubic feet per second, 1957

66. SOUTH FORK LITTLE BARREN RIVER AT EDMONTON, KY.

Location.—Lat $36^{\circ}58'27''$, long $85^{\circ}36'11''$, on right bank 13 ft downstream from bridge on State Highway 496, three-quarters of a mile southeast of Edmonton, Metcalfe County, and 3.0 miles upstream from Rogers Creek.

Drainage area.—18.1 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 742.83 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 1,200 cfs and extended above by logarithmic plotting.

Maxima.—January-February 1957: Discharge, 1,510 cfs 10:30 p.m. Jan. 22 (gage height, 7.91 ft).

1941 to December 1956: Discharge, 2,140 cfs June 15, 1949 (gage height, 10.00 ft).

Mean discharge, in cubic feet per second, 1957

67. GREEN RIVER AT MUNFORDVILLE, KY.

Location.—Lat $37^{\circ}16'05''$, long $85^{\circ}53'10''$, on right bank at downstream side of pier of bridge on U.S. Highway 31W at Munfordville, Hart County.

Drainage area.—1,790 sq mi, approximately.

Gage-height record.—Water-stage recorder graph. Datum of gage is 451.70 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 31,600 cfs 6 a.m. Feb. 1 (gage height, 36.94 ft).

1915-22, 1927-31, 1936-37, 1937 to December 1956: Discharge, 72,200 cfs Jan. 23, 1937 (gage height, 50.40 ft, from floodmarks, at site 0.2 mile downstream at same datum).

Maximum stage known, 54.0 ft in January 1913, at former site (discharge 87,000 cfs).

FLOODS OF 1957

68. BARREN RIVER NEAR PAGEVILLE, KY.

Location.—Lat $36^{\circ}51'09''$, long $86^{\circ}04'37''$, near right bank on downstream side of bridge pier on U.S. Highway 31E, 100 ft upstream from Hurricane Creek, 1.8 miles south of Pageville, Barren County, and 2.3 miles upstream from Peter Creek.

Drainage area.—531 sq mi, of which about 20 sq mi does not contribute directly to surface runoff.

Gage-height record.—Water-stage recorder graph. Datum of gage is 505.47 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 40,000 cfs.

Maxima.—January–February 1957: Discharge, 42,800 cfs 2 a.m. Jan. 30 (gage height, 23.76 ft).

1939 to December 1956: Discharge, 70,000 cfs Mar. 23, 1952 (gage height, 27.26 ft.).

Mean discharge, in cubic feet per second, 1957

Day	January	February	Day	January	February	Day	January	February

69. WEST BAYS FORK AT SCOTTSVILLE, KY.

Location.—Lat $36^{\circ}44'53''$, long $86^{\circ}11'47''$, on downstream side of left abutment of bridge on U.S. Highway 31E, 0.5 mile southwest of Scottsville, Allen County, and 6.4 miles upstream from mouth.

Drainage area.—7.52 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 637.61 ft above mean sea level, datum of 1929, supplemental adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 1,100 cfs and by slope-area measurement at 1,640 cfs.

Maxima.—January-February 1957: Discharge, 1,510 cfs 4 a.m. Jan. 29 (gage height, 5.64 ft).

1950 to December 1956: Discharge, 1,640 cfs Mar. 22, 1952 (gage height, 6.09 ft).

Mean discharge, in cubic feet per second, 1957

70. DRAKES CREEK NEAR ALVATON, KY.

Location.—Lat $36^{\circ}53'42''$, long $86^{\circ}23'21''$, on right bank at downstream side of abandoned bridge, 0.5 mile upstream from State Highway 71, 2.5 miles northwest of Alvaton, Warren County, and 4.8 miles downstream from Trammel Fork.

Drainage area.—478 sq mi, of which about 120 sq mi does not contribute directly to surface runoff.

Gage-height record.—Water-stage recorder graph. Datum of gage is 443.07 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 34,300 cfs 11 p.m. Jan. 29 (gage height, 31.54 ft).

1939 to December 1956: Discharge, 30,900 cfs Feb. 14, 1948 (gage height, 30.70 ft).

Mean discharge, in cubic feet per second, 1957

Day	January	February	Day	January	February	Day	January	February
1	190	5,180	12	522	2,030	23	12,900	1,350

71. BARREN RIVER AT BOWLING GREEN, KY.

Location.—Lat $37^{\circ}00'04''$, long $86^{\circ}25'51''$, on downstream side of College Street bridge, 600 ft downstream from bridge on U.S. Highways 31W and 68 at Bowling Green, Warren County, 800 ft upstream from Louisville and Nashville Railroad bridge, 6 miles downstream from Drakes Creek, and 8.9 miles upstream from Jennings Creek.

Drainage area.—1,848 sq mi, of which about 490 sq mi does not contribute directly to surface runoff.

Gage-height record.—Water-stage recorder graph. Graph drawn for auxiliary staff gage, 7.7 miles downstream, from once or twice daily readings. Datum of gage is 409.83 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements. Fall used as a factor Jan. 23 to Feb. 17, Feb. 20-23, 27, 28.

Maxima.—January-February 1957: Discharge, 66,100 cfs 10 p.m. Jan. 30 (gage height, 41.50 ft); gage height, 42.07 ft 4 a.m. Jan. 31.

1938 to December 1956: Discharge, 77,400 cfs Mar. 24, 1952; gage height, 44.63 ft Mar. 24, 1952.

Maximum stage known, 52.2 ft Jan. 8, 1913, from floodmarks.

Mean discharge, in cubic feet per second, 1957

Day	January	February	Day	January	February	Day	January	February
1	1,020	33,000	12	3,530	10,200	23	11,700	5,270

CUMBERLAND RIVER BASIN

72. POOR FORK AT CUMBERLAND, KY.

Location.—Lat $36^{\circ}58'26''$, long $82^{\circ}59'35''$, at left downstream side of Second Street Bridge at Cumberland, Harlan County, 0.1 mile upstream from Cloverlick Creek, and 0.5 mile downstream from Looney Creek.

Drainage area.—82.3 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,415.15 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 3,500 cfs and slope-area measurement of 11,700 cfs.

Maxima,—January–February 1957: Discharge, 11,800 cfs 3 p.m. Jan. 29 (gage height, 11.50 ft).

1940 to December 1956: Discharge, 7,500 cfs Jan. 7, 1946 (gage height, 9.65 ft).

Flood of January 1927 reached a stage of about 10.2 ft (discharge 12,000 cfs, estimated by Corps of Engineers).

Mean discharge, in cubic feet per second, 1957

73. CUMBERLAND RIVER NEAR HARLAN, KY.

Location.—Lat $36^{\circ}50'48''$, long $83^{\circ}21'21''$, on left bank 10 ft downstream from bridge on U.S. Highway 119 at Loyal, 1.6 miles upstream from Fourmile Branch, 2.0 miles downstream from Poor and Clover Forks, and 2 miles west of Harlan, Harlan County. Drainage area.—374 sq mi.

Gage-height record.—Water-stage recorder graph except Jan. 17–19. Datum of gage is 1,140.10 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 22,000 cfs. Discharge for Jan. 17–19 estimated on basis of records for nearby stations.

Maxima.—January–February 1957: Discharge, 31,000 cfs 6 p.m. Jan. 29 (gage height, 19.89 ft).

1940 to December 1956: Discharge, 37,900 cfs Jan. 8, 1946 (gage height, 22.81 ft).

Floods of 1918 and 1929 reached stages of about 22 and 20.0 ft respectively, from information by local residents.

74. YELLOW CREEK NEAR MIDDLESBORO, KY.

Location.—Lat $36^{\circ}39'02''$, long $83^{\circ}42'04''$, on right bank on U.S. Highway 25E, 0.4 mile upstream from Low Ash Hollow, 3 miles north of Middlesboro, Bell County, and 6.0 miles upstream from Clear Fork.

Drainage area.—58.2 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,104.20 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 3,980 cfs 8 p.m. Jan. 28 (gage height, 15.31 ft).

1940 to December 1956: Discharge, 6,160 cfs Jan. 7, 1946 (gage height, 20.92 ft).

Flood of March 1929 reached a stage of about 19.6 ft; flood of Feb. 3, 1939 reached a stage of 18.5 ft, from floodmarks.

75. CUMBERLAND RIVER AT PINEVILLE, KY.

[Gaging station, discontinued 1931]

Location.—Lat $36^{\circ}44'48''$, long $83^{\circ}41'34''$, on left bank 300 ft upstream from bridge on U.S. Highway 119, 300 ft downstream from Clear Creek, and 1 mile south of Pineville, Bell County.

Drainage area.—676 sq mi (revised).

Gage-height record.—Floodmarks only. Datum of gage is 984.28 ft above mean sea level.

Discharge record.—Stage-discharge relation defined by current-meter measurements in 1929-31 below 23,000 cfs.

Maxima.—January-February 1957: Discharge, 45,000 cfs Jan. 29 (gage height, 32.62 ft, from floodmarks).

1929-31: Discharge, 23,400 cfs Apr. 22, 1931 (gage height, 17.76 ft).

76. STRAIGHT CREEK AT JENSEN, KY.

[Miscellaneous site]

Location.—Lat $36^{\circ}46'20''$, long $83^{\circ}38'55''$, 0.9 miles downstream from Elliott Branch, 1.0 mile west of Jensen, 1.1 miles east of town of Straight Creek, Bell County, and 1.3 miles upstream from Left Fork Straight Creek.

Drainage area.—53.8 sq mi.

Discharge record.—Peak discharge by slope-area measurement.

Maximum.—January-February 1957: Discharge, 16,700 cfs Jan. 29.

77. CUMBERLAND RIVER NEAR PINEVILLE, KY.

Location.—Lat $36^{\circ}48'48''$, long $93^{\circ}45'58''$, on downstream side of bridge on U.S. Highway 25 E, 0.5 mile south of Flat Lick, 2.4 miles downstream from Greasy Creek, 4.7 miles upstream from Stinking Creek, and 5.0 miles northwest of Pineville, Bell County.

Drainage area.—809 sq mi.

Gage-height record.—Water-stage recorder graph, except Jan. 1-11, Jan. 29 to Feb. 1, when graph was drawn from twice-daily wire-weight gage readings, floodmarks, and shape of graph for auxiliary gage. Graph drawn for auxiliary staff gage, 1.9 miles upstream, from once or twice daily readings, except Jan. 28 to Feb. 2, when hourly readings were made. Datum of gage is 955.45 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-fall-discharge relation or stage-discharge relation defined by current-meter measurements below 36,000 cfs and by slope-area measurements at gage heights 44.34, 47.3, 47.35, and 49.31 ft. Fall used as a factor Jan. 10-12, 24, 25, 9 p.m., Jan. 29 to Feb. 12, Feb. 20-22.

Maxima.—January-February 1957: Discharge, 54,900 cfs 11 p.m. Jan. 29 (gage height, 47.35 ft, from floodmarks).

1938 to December 1956: Discharge, 57,900 cfs Jan. 8, 1946 (gage height, 49.31 ft).

Flood of March 1929 reached a stage of 47.3 ft (discharge 51,000 cfs).

Remarks.—Auxiliary gage readings Jan. 28 to Feb. 2, furnished by Kentucky Utilities Co.

78. CUMBERLAND RIVER AT BARBOURVILLE, KY.

Location.—Lat $36^{\circ}51'45''$, long $83^{\circ}53'13''$, near center of span on upstream side of bridge on State Highway 11, at Barbourville, Knox County, 0.4 mile upstream from Richland Creek.

Drainage area.—960 sq mi.

Gage-height record.—Graph drawn from twice-daily wire-weight gage readings, except Jan. 29–31, when hourly readings were made, and Jan. 28, Feb. 1–3 when 4 to 8 readings a day were made. Datum of gage is 942.97 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 30,000 cfs and extended above on basis of runoff comparison with nearby stations. Rate of change in stage used as a factor Jan. 9–13, 23–25, Jan. 28 to Feb. 5, Feb. 8–13, 19–22.

Maxima.—January–February 1957: Discharge, 43,000 cfs 9 a.m. Jan. 30 (gage height, 42.15 ft); gage height, 42.28 ft 12 m. Jan. 30.

1922–31, 1948 to December 1956: Discharge, 47,900 cfs May 31, 1927; gage height, 40.25 ft Feb. 2, 1951.

Flood of January 1946 reached a stage of 42.8 ft, present datum.

Remarks.—Gage readings Jan. 28 to Feb. 3, 1957, furnished by Corps of Engineers.

79. CUMBERLAND RIVER AT WILLIAMSBURG, KY.

Location.—Lat 36°44'38", long 84°09'30", on left bank 10 ft downstream from bridge on U.S. Highway 25 W and State Highway 92 at Williamsburg, Whitley County, and 2.1 miles downstream from Clear Fork.

Drainage area.—1,607 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 891.52 ft above sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 49,700 cfs 11 p.m. Jan. 31 (gage height, 33.78 ft).

1950 to December 1956: Discharge, 37,200 cfs Feb. 2, 1951 (gage height, 29.85 ft).

Maximum stage since at least 1918, 34.2 ft Jan. 10, 1946, from graph based on U.S. Weather Bureau gage readings. Flood of Mar. 25, 1929, reached a stage of 32.7 ft, from graph based on U.S. Weather Bureau gage readings.

Mean discharge, in cubic feet per second, 1957

80. CUMBERLAND RIVER AT CUMBERLAND FALLS, KY.

Location.—Lat $36^{\circ}50'14''$, long $84^{\circ}20'36''$, on left bank 700 ft downstream from bridge on State Highway 90 and 1,200 ft upstream from Cumberland Falls, Whitley County.

Drainage area.—1,977 sq mi.

Gage-height record.—Water-stage recorder graph, except Jan. 1-7. Datum of gage is 825.49 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Discharge for period Jan. 1-7 estimated on basis of recorded range in stage and records for stations on nearby streams.

Maxima.—January-February 1957: Discharge, 57,400 cfs 3 p.m. Jan. 29 (gage height, 14.55 ft).

1907-11, 1915 to December 1956: Discharge, 59,600 cfs Jan. 28, 1918 (gage height, 15.5 ft.).

81. LAUREL RIVER AT CORBIN, KY.

Location.—Lat $36^{\circ}51'09''$, long $84^{\circ}07'38''$, on left bank 200 ft downstream from bridge on State Highway 312, three-quarters of a mile northwest of Corbin city boundary, Whitley County, and 1.0 mile downstream from Lynn Camp Creek.

Drainage area.—201 sq mi.

Gage-height record.—Water-stage recorder graph except Feb. 4-7; graph for Feb. 4-5 drawn from one staff gage reading Feb. 5, trend of recorder graph, and shape of recession. Datum of gage is 965.05 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 9,000 cfs and contracted-opening measurement at 16,200 cfs. Discharge for Feb. 6, 7 estimated on basis of weather records and records for stations on nearby streams.

Maxima.—January-February 1957: Discharge, 16,200 cfs 3:30 p.m. Jan. 29 (gage height, 19.30 ft).

1922-24, 1942 to December 1956: Discharge, 14,400 cfs Jan. 8, 1946 (gage height, 17.94 ft).

Floods of 1911, 1913, and 1922, reached a stage of 19 ft, from information by Corps of Engineers.

82. WOOD CREEK NEAR LONDON, KY.

Location.—Lat $37^{\circ}09'40''$, long $84^{\circ}06'43''$, on left bank 50 ft downstream from bridge on U.S. Highway 25, 0.2 mile upstream from Peacock Branch, 2.8 miles northwest of London, Laurel County, and about 12 miles upstream from mouth.

Drainage area.—3.89 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,123.50 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 160 cfs and extended above by logarithmic plotting.

Maxima.—January–February 1957: Discharge, 306 cfs 8:30 a.m. Jan. 29 (gage height, 4.97 ft).

1953 to December 1957: Discharge, 506 cfs Feb. 17, 1956 (gage height, 6.23 ft).

83. ROCKCASTLE RIVER AT BILLOWS, KY.

Location.—Lat $37^{\circ}10'16''$, long $84^{\circ}17'46''$, on left bank 200 ft upstream from bridge on State Highway 80 at Billows, Rockcastle County, 1.0 mile downstream from Hawk Creek, 1.0 mile upstream from Pine Creek, and 13 miles west of London.

Drainage area.—604 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 802.90 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 25,000 cfs 3:30 a.m. Jan. 30 (gage height, 31.90 ft).

1936 to December 1956: Discharge, 46,800 cfs June 29, 1947 (gage height, 45.48 ft).

Flood of January 1913 reached a stage of about 40 ft, from information by Corps of Engineers.

Mean discharge : cubic feet per second, 1957

86. BUCK CREEK NEAR SHOPVILLE, KY.

Location.—Lat $37^{\circ}12'38''$, long $84^{\circ}27'52''$, on right bank on downstream side of bridge on State Highway 461, 0.2 mile downstream from Brushy Creek, 3.7 miles north of Shopville, and 11.5 miles northeast of Somerset, Pulaski County.

Drainage area.—165 sq mi.

Gage-height record.—Water-stage recorder graph except Jan. 18, 19, Feb. 4–14. Datum of gage is 835.35 ft above mean sea level, unadjusted.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 7,000 cfs and by contracted-opening measurement at 14,900 cfs in November 1957. Discharge for Jan. 18, 19, Feb. 8–14 estimated on basis of 1 discharge measurement, weather records, recorded range in stage, and records for stations on nearby streams.

Maxima.—January–February 1957: Discharge, 9,710 cfs 3:45 p.m. Jan. 29 (gage height, 15.19 ft).

1952 to December 1956: Discharge, 10,800 cfs Feb. 18, 1956 (gage height, 15.72 ft).

Mean discharge, in cubic feet per second, 1957

Runoff, in inches							6.35	4.84

87. NEW RIVER AT NEW RIVER, TENN.

Location.—Lat $36^{\circ}23'08''$, long $84^{\circ}33'17''$, on left bank at town of New River, Scott County, 700 ft downstream from Phillips Creek, 1,000 ft downstream from bridge on U.S. Highway 27, 1.7 miles downstream from Brimstone Creek, and at mile 8.6.

Drainage area.—382 sq mi.

Gage-height record.—Water-stage recorder graph except 6 a.m. Jan. 30 to 9 a.m. Feb. 8 for which graph was estimated on basin of recorded range in stage, floodmark in well, weather records, and records for Clear Fork near Robbins. Datum of gage is 1,092.67 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 26,000 cfs.

Maxima.—January–February 1957: Discharge, 29,200 cfs 5:30 a.m. Jan. 29 (gage height, 26.00 ft).

1934 to December 1956: Discharge, 44,300 Feb. 3, 1939 (gage height, 33.58 ft).

Maximum stage known, 41.2 ft Mar. 23, 1929, on old U.S. Weather Bureau gage 1,200 ft upstream and at datum 3.41 ft higher.

Flood of March 1902 was approximately 7 ft lower than that of Mar. 23, 1929, from profile by Corps of Engineers.

Mean discharge, in cubic feet per second, 1957

88. CLEAR FORK NEAR ROBBINS, TENN.

Location.—Lat $36^{\circ}23'18''$, long $84^{\circ}37'49''$, on right bank 300 ft downstream from Burnt Mill Bridge, 3.3 miles northwest of Robbins, Scott County, and at mile 3.7.

Drainage area.—272 sq mi.

Gage-height record.—Water-stage recorder graph except 6 a.m. Jan. 29 to 9 a.m. Jan. 31 for which graph was estimated on basis of weather records and records for New River at New River. Datum of gage is 1,081.46 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Affected by ice Jan. 18-20.

Maxima,—January-February 1957: Discharge, 15,000 cfs 8 p.m. Jan. 28 (gage height, 12.90 ft).

1930 to December 1956: Discharge, 34,000 cfs Feb. 3, 1939 (gage height, 18.5 ft, at site 300 ft upstream and at datum 1.00 ft higher), on basis of slope-area measurement.

Maximum stage known, 22.1 ft Mar. 23, 1929, at site 300 ft upstream and datum 1.00 ft higher, from information by local residents.

89. SOUTH FORK CUMBERLAND RIVER NEAR STEARNS, KY.

Location.—Lat $36^{\circ}37'37''$, long $84^{\circ}32'$, on right bank at mouth of Bear Creek, 1,600 ft upstream from Salt Branch and 5.5 miles southwest of Stearns, McCreary County. Records include flow of Bear Creek.

Drainage area.—954 sq mi, includes that of Bear Creek.

Gage-height record.—Water-stage recorder graph, except Jan. 28–30, when graph was reconstructed from numerous radio gage readings and floodmark. Datum of gage is 764.81 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 61,500 cfs 12:30 p.m. Jan. 29 (gage height, 36.25 ft, from floodmark).

1942 to December 1956: Discharge, 69,600 cfs Feb. 13, 1948 (gage height, 38.50 ft). Maximum stage known, 52.9 ft in March 1929, from information by local residents.

90. PITMAN CREEK AT SOMERSET, KY.

Location.—Lat $37^{\circ}07'01''$, long $84^{\circ}35'31''$, on right bank 0.1 mile downstream from Dry Branch, 0.5 mile upstream from Caney Fork, and 1.9 miles northeast at Somerset, Pulaski County.

Drainage area.—31.3 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 867.34 ft above mean sea level, datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 1,500 cfs.

Maxima.—January-February 1957: Discharge, 2,260 cfs 9:15 p.m. Jan. 22 (gage height, 7.43 ft).

1953 to December 1956: Discharge, 2,430 cfs Mar. 21, 1955 (gage height, 7.58 ft).

91. LAKE CUMBERLAND NEAR JAMESTOWN, KY.

Location.—Lat $36^{\circ}52'09''$, long $85^{\circ}08'45''$, in pylon of Wolf Creek dam on Cumberland River, 10 miles southwest of Jamestown, Russell County.

Drainage area.—5,789 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is at mean sea level, Sandy Hook datum.

Maxima.—January-February 1957: Contents, 2,313,200 cfs-days 3 a.m. to 10 a.m. Feb. 13 (elevation 734.40 ft).

1950 to December 1956: Contents, 2,505,800 cfs-days Dec. 23, 1951 (elevation, 741.32 ft).

Remarks.—Reservoir is formed by earth embankment and concrete gravity dam surrounded by 10 tainter gates 37 ft high by 50 ft wide. Final closure of dam made Aug. 7, 1950. Total capacity at elevation 760.00 ft (top of gates) is 3,070,000 cfs-days, of which 1,056,000 cfs-days above elevation 723.00 ft (crest of spillway) are reserved for flood control and 1,080,000 cfs-days between elevations 673.00 ft (minimum power pool) and 723.00 ft will be used for power production. Figures given herein represent total contents, of which 934,000 cfs-days below elevation 673.00 ft are dead storage. Reservoir is used for flood control, power, and navigation. Gage-height record and contents furnished by Corps of Engineers.

Elevation, in feet, and contents, in cfs-days at 12 p.m. of indicated day, 1957

Supplemental record.—Dec. 31, 1956, 12 p.m., 697.49 ft, 1,417,500 cfs-days.

92. CUMBERLAND RIVER NEAR ROWENA, KY.

Location.—Lat $36^{\circ}53'02''$, long $85^{\circ}08'22''$, on right bank, 1.5 miles downstream from Wolf Creek Dam, 1.9 miles upstream from Blackfish Creek, 1.9 miles west of Rowena, Russell County, and at mile 459.4.

Drainage area.—5,790 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 540.81 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 50,000 cfs.

Maxima.—January-February 1957: Discharge, 27,500 cfs 1-6 a.m. Feb. 22 (gage height, 21.43 ft).

1939 to December 1956: Discharge, 162,000 cfs Jan. 9, 1946; gage height, 64.82 ft Jan. 9, 1946.

Maximum stage known, 69.5 ft in March 1826 from Cumberland River profile.

Remarks.—Flow regulated by Lake Cumberland (see station 90).

Mean discharge, in cubic feet per second, 1957

Day	January	February	Day	January	February	Day	January	February

Adjusted monthly discharge, in cubic feet per second-----							34,550	32,060

93. EAST FORK OBEY RIVER NEAR JAMESTOWN, TENN.

Location.—Lat $36^{\circ}24'58''$, long $85^{\circ}01'35''$, on right bank, 200 ft upstream from bridge on State Highway 52, 0.5 mile upstream from Poplar Cove Creek, 5.3 miles west of Jamestown, Fentress County, and 12.8 miles upstream from confluence with West Fork.

Drainage area.—202 sq mi (includes 6 sq mi without surface drainage).

Gage-height record.—Water-stage recorder graph except 6 p.m. Feb. 10 to 11 a.m. Feb. 17 for which graph was constructed based on bi-hourly radio gage readings. Datum of gage is 680.30 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 16,900 cfs 4:30 p.m. Jan. 29 (gage height, 19.41 ft).

1942 to December 1956: Discharge, 28,300 cfs Feb. 13, 1948 (gage height, 27.20 ft).

Flood of March 1929 reached a stage of about 30 ft, from profile by Corps of Engineers.

94. WEST FORK OBEY RIVER NEAR ALPINE, TENN.

Location.—Lat $36^{\circ}23'49''$, long $85^{\circ}10'28''$, on upstream end of left pier of bridge on State Highway 52, 0.3 mile upstream from Nettlecarrier Creek, 2.4 miles east of Alpine, Overton County, and 7.8 miles above confluence with East Fork.

Drainage area.—115 sq mi (includes 34 sq mi without surface drainage).

Gage-height record.—Water-stage recorder graph. Datum of gage is 684.28 ft above mean sea level, unadjusted datum of 1929.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January-February 1957: Discharge, 9,510 cfs 2 p.m. Jan. 29 (gage height, 12.65 ft).

1942 to December 1956: Discharge, 15,100 cfs Mar. 21, 1955 (gage height, 16.30 ft).

Flood of March 1929 was about 3 ft lower than that of Mar. 21, 1955, from profile by Corps of Engineers.

Mean discharge, in cubic feet per second, 1957

95. WOLF RIVER NEAR BYRDSTOWN, TENN.

Location.—Lat 36°33'40", long 85°04'20", on right bank a quarter of a mile upstream from new bridge on county road, half a mile upstream from Widow Creek, 3 miles east of Byrdstown, Pickett County, and 5 miles upstream from Lick Creek.

Drainage area.—105 sq mi.

Gage-height record.—Water-stage recorder graph except 8 a.m. to 9 p.m. Feb. 19 for which graph was constructed based on bi-hourly radio gage readings. Datum of gage is 707.54 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 7,300 cfs and extended above on basis of velocity-area study.

Maxima.—January–February 1957: Discharge, 22,600 cfs 1 p.m. January 29 (gage height, 10.84 ft).

1943 to December 1956: Discharge, 14,100 cfs Mar. 22, 1955 (gage height, 9.06 ft).

Remarks.—Some regulation at low flow caused by small mills above station.

96. DALE HOLLOW RESERVGIR NEAR CELINA, TENN.

Location.—Lat $36^{\circ}32'19''$, long $85^{\circ}27'05''$, at Dale Hollow Dam on Obey River, 3 miles east of Celina, Clay County, Tenn., and 7.3 miles upstream from mouth.

Drainage area.—935 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is at mean sea level, Sandy Hook datum.

Maxima.—January–February 1957: Contents at 12 p.m., 677,800 cfs-days Feb. 10, 11 (elevation, 650.68 ft).

1943 to December 1956: Contents, 780,000 cfs-days Feb. 10, 1950 (elevation, 657.8 ft).

Remarks.—Storage capacity, 860,000 cfs-days (elevation 663.0 ft) of which 428,000 cfs-days is controlled storage. Records furnished by Corps of Engineers.

97. OBEY RIVER BELOW DALE HOLLOW DAM, TENN.

Location.—Lat $36^{\circ}32'12''$, long $85^{\circ}27'22''$, on right bank, 1,200 ft downstream from Dale Hollow Dam, 3 miles east of Celina, Clay County, 7.1 miles upstream from mouth, and 24 miles downstream from Wolf River.

Drainage area.—935 sq mi.

Gage-height record.—Water-stage recorder graph except 1 p.m. Jan. 29 to 11 a.m. Feb. 26 at auxiliary gage at station on Cumberland River Celina for which graph was drawn based on bi-hourly radio gage readings. Datum of gage is 500.00 ft above mean sea level, Sandy Hook datum.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Discharge computed by slope method.

Maxima.—January–February 1957: Discharge, 6,160 cfs 9 a.m. Jan. 29; gage height, 25.20 ft 7 p.m. Jan. 29 (backwater from Cumberland River).

1938–42, 1943 to December 1956: Discharge, 41,400 cfs Feb. 4, 1939, at site 5.2 miles upstream, from rating curve extended above 20,000 cfs; gage height, 43.40 ft Jan. 12, 1946 (backwater from Cumberland River).

Remarks.—Flow completely regulated by Dale Hollow Reservoir since Aug. 30, 1943.

98. CUMBERLAND RIVER AT CELINA, TENN.

Location.—Lat $36^{\circ}33'20''$, long $85^{\circ}30'47''$, on right pier of bridge on State Highway 52 at Celina, Clay County, 600 ft downstream from Obey River, and at mile 380.8.

Drainage area.—7,320 sq mi, approximately.

Gage-height record.—Water-stage recorder graph except 1 p.m. Jan. 29 to 11 a.m. Feb. 26 for which graph was drawn based on bi-hourly radio gage readings. Datum of gage is 488.97 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Discharges at all stages affected by rate of change in stage.

Maxima.—January–February 1957: Discharge, 66,500 cfs 9:30 a.m. Jan. 29; gage height, 34.10 ft 6 p.m. Jan. 29.

1922 to December 1956: Discharge, 145,000 cfs Dec. 29, 1926; gage height, 57.25 ft Dec. 29, 1926, from graph based on gage readings.

Maximum stage known, 59.2 ft in March 1826, from profile by Corps of Engineers.

A flood in 1793 may have exceeded the one in March 1826.

Remarks.—Flow regulated by Lake Cumberland and Dale Hollow Reservoirs.

TENNESSEE RIVER BASIN

99. LITTLE PIGEON RIVER ABOVE WEST FORK LITTLE PIGEON RIVER AT SEVIERVILLE, TENN.

[Crest-stage station]

Location.—Lat $35^{\circ}52'12''$, long $83^{\circ}34'04''$, on right bank at State Highway 66 bridge, in Sevierville, Sevier County, 150 ft upstream from West Fork, and $4\frac{1}{4}$ miles downstream from East Fork.

Drainage area.—201 sq mi (determined by Tennessee Valley Authority from $7\frac{1}{2}$ -minute planimetric maps, scale, 1:24,000).

Gage-height record.—Crest stages only.

Discharge record.—Peak discharges from rating curve extended above 11,700 cfs.

Maxima.—January–February 1957: Discharge, 12,800 cfs Jan. 31 (gage height, 15.59 ft).

February 1954 to December 1956: Discharge, 10,800 cfs Apr. 16, 1956 (gage height, 13.76 ft).

100. WEST FORK LITTLE PIGEON RIVER NEAR PIGEON FORGE, TENN.

[Crest-stage station]

Location.—Lat $35^{\circ}48'21''$, long $83^{\circ}34'28''$, on left bank at old State Highway 71 bridge, 1.4 miles upstream from Waldon Creek, 1.6 miles northwest of Pigeon Forge, Sevier County, and 9 miles upstream from mouth.

Drainage area.—76.2 sq mi (determined by Tennessee Valley Authority from $7\frac{1}{2}$ -minute planimetric maps, scale, 1:24,000).

Gage-height record.—Crest stages only.

Discharge record.—Peak discharges from rating curve extended above 4,900 cfs.

Maxima.—January–February 1957: Discharge, 6,400 cfs Jan. 31 (gage height, 10.98 ft).

February 1946 to July 1949, February 1954 to December 1956: Discharge, 5,640 cfs Jan. 20, 1947 (gage height, 10.30 ft).

101. LITTLE PIGEON RIVER AT SEVIERVILLE, TENN.

Location.—Lat $35^{\circ}52'34''$, long $83^{\circ}34'36''$, on left bank at Eckel farmhouse, 0.5 mile downstream from city limits of Sevierville, Sevier County, and 0.5 mile downstream from West Fork Little Pigeon River.

Drainage area.—353 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 881.44 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 20,000 cfs.

Maxima.—January–February 1957: Discharge, 28,300 cfs 12:30 a.m. Feb. 1 (gage height, 14.71 ft).

1920 to December 1956: Discharge, 32,000 cfs June 29, 1928 (gage height, 15.4 ft).

Flood of Feb. 25, 1875 reached a stage of about 18 ft (discharge, about 55,000 cfs) and the floods of 1896 and 1867, reached stages of about 16.8 and 16.5 ft, respectively, from reports by Tennessee Valley Authority.

Remarks.—Some regulation at low flow caused by powerplants on forks.

102 SOUTH FORK HOLSTON RIVER AT RIVERSIDE, NEAR CHILHOWIE, VA.

Location.—Lat $36^{\circ}45'37''$, long $81^{\circ}37'52''$, on right bank 400 ft upstream from highway bridge at Riverside, Smyth County, 900 ft upstream from Spring Branch, 3.2 miles downstream from Redstone Branch, and 4 miles southeast of Chilhowie.

Drainage area.—76.1 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 2,106.77 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January-February 1957: Discharge, 3,800 cfs 10 p.m. Jan. 29 (gage height, 8.32 ft).

1920-31, 1942 to December 1956: Discharge, 6,000 cfs June 12, 1923 (gage height, 9.0 ft, from graph based on gage readings, at site 400 ft downstream).

Mean discharge, in cubic feet per second, 1957

103. BEAVERDAM CREEK AT DAMASCUS, VA.

Location.—Lat $36^{\circ}37'40''$, long $81^{\circ}47'28''$, on right bank in pumphouse of American Cyanamid Co., at Damascus, Washington County, 0.65 mile upstream from mouth.

Drainage area.—56.0 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,946.66 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,600 cfs.

Maxima.—January–February 1957: Discharge, 4,200 cfs 8 p.m. Jan. 29 (gage height, 5.75 ft).

1947 to December 1956: Discharge, 5,280 cfs Mar. 18, 1955 (gage height, 5.75 ft).

106. MIDDLE FORK HOLSTON RIVER AT SEVENMILE FORD, VA.

Location.—Lat $36^{\circ}48'26''$, long $81^{\circ}37'20''$, on right bank at downstream side of bridge on U.S. Highway 11 at Sevenmile Ford, Smyth County, 0.3 mile upstream from Meade Creek, and 3.3 miles downstream from Walker Creek.

Drainage area.—132 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,960.00 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January–February 1957: Discharge, 7,680 cfs 8 p.m. Jan. 29 (gage height, 10.75 ft).

1942 to December 1956: Discharge, 6,570 cfs Aug. 4, 1947 (gage height, 9.86 ft).

Mean discharge, in cubic feet per second, 1957

107. SOUTH HOLSTON LAKE NEAR BRISTOL, VA.-TENN.

Location.—Lat $36^{\circ}31'15''$, long $82^{\circ}05'11''$, 470 ft upstream from South Holston Dam on South Fork Holston River in Sullivan County, Tenn., 7.0 miles southeast of Bristol, Virginia-Tennessee, and at mile 49.8.

Drainage area.—703 sq mi.

Gage-height record.—Water-stage recorder. Datum of gage is at mean sea level, datum of 1929, supplementary adjustment of 1936.

Maxima.—January-February 1957: Contents at 12 p.m., 300,800 cfs-days Feb. 11(elevation, 1,723.36 ft).

1950 to December 1956: Contents, 293,800 cfs-days, Apr. 14, 1952(elev., 1,721.40 ft).

Remarks.—Storage capacity, 375,100 cfs-days (elevation, 1,742.00 ft) of which 315,200 cfs-days is controlled storage. Records furnished by Tennessee Valley Authority.

Elevation, in feet, and contents, in cfs-days at 12 p.m. of indicated day, 1957

108. SOUTH FORK HOLSTON RIVER BELOW SOUTH HOLSTON DAM, TENN.

Location.—Lat $36^{\circ}31'25''$, long $82^{\circ}05'50''$, on right bank 1,900 ft downstream from South Holston Dam Powerhouse, 1.0 mile upstream from bridge at Bristol waterworks, 1.0 mile upstream from Thomas Creek, 6.7 miles southeast of Bristol, Sullivan County, and at mile 49.4.

Drainage area.—703 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,450.00 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 8,270 cfs 4:10 p.m. Feb. 12 (gage height, 40.45 ft).

1951 to December 1956: Discharge, 3,360 cfs Sept. 13, 1953 (gage height, 37.70 ft).

Maximum stage known since at least 1791, about 55 ft in March 1867, from profile by Tennessee Valley Authority.

Remarks.—Flow regulated by South Holston Lake.

Mean discharge, in cubic feet per second, 1957

*Flow affected by regulation; daily means cannot be computed exactly from data shown.

109. BEAVER CREEK NEAR WALLACE, VA.

Location.—Lat $36^{\circ}38'25''$, long $82^{\circ}06'42''$, on left bank 0.4 mile upstream from Clear Creek, 1.3 miles southeast of Wallace, Washington County, and 3.8 miles northeast of Bristol.

Drainage area.—13.7 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,808.93 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 278 cfs 4 p.m. Jan. 29 (gage height, 4.48 ft).

1945 to December 1956: Discharge, 383 cfs July 15, 1948 (gage height, 5.94 ft), from rating curve extended above 230 cfs on basis of velocity-area studies.

110. WATAUGA RIVER NEAR SUGAR GROVE, N. C.

Location.—Lat $36^{\circ}14'18''$, long $81^{\circ}49'22''$, on right bank 300 ft downstream from Cove Creek and 2.3 miles southwest of Sugar Grove, Watauga County.

Drainage area,—90.8 sq mi.

Gage-height record.—Water stage recorder graph. Datum of gage is 2,607.84 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,100 cfs and by slope-area measurement at 50,800 cfs.

Maxima.—January–February 1957: Discharge, 2,200 cfs 10:30 p.m. Jan. 31 (gage height, 6.45 ft).

1940 to December 1956: Discharge, 50,800 cfs Aug. 13, 1940 (gage height, 29.6 ft).

111. WATAUGA LAKE NEAR ELIZABETHTON, TENN.

Location.—Lat $36^{\circ}19'20''$, long $82^{\circ}07'06''$, at Watauga Dam on Watauga River, 5 miles east of Elizabethton, Carter County, Tenn., and at mile 36.7.

Drainage area.—468 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is at mean sea level, datum of 1929, supplementary adjustment of 1936.

Maxima.—January–February 1957: Contents at 12 p.m., 249,800 cfs-days Feb. 28 (elevation, 1,946.96 ft).

1948 to December 1956: Contents, 285,900 cfs-days June 24, 1950 (elevation, 1,958.58 ft).

Remarks.—Storage capacity, 342,200 cfs-days (elevation, 1,975.00 ft) of which 316,200 cfs-days is controlled storage. Records furnished by Tennessee Valley Authority.

Elevation, in feet, and contents, in cfs-days at 12 p.m. of indicated day, 1957

112. WATAUGA RIVER BELOW WILBUR DAM, TENN.

Location.—Lat $36^{\circ}20'39''$, long $82^{\circ}07'46''$, 1,800 ft downstream from Wilbur Dam, 0.7 mile downstream from Big Laurel Branch, 2.7 miles downstream from Watauga Dam, and 5 miles east of Elizabethton, Carter County.

Drainage area.—471 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,550.00 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 2,890 cfs 7:30 p.m. Jan. 3 (gage height, 35.38 ft).

1902–8, 1948 to December 1956: Discharge, 21,500 cfs Jan. 22, 1906 (gage height, 13.6 ft, at site 2 miles downstream at different datum), from rating curve extended above 2,500 cfs.

The flood of Aug. 13, 1940 (discharge, 71,500 cfs at former gaging station at Butler, drainage area, 427 sq mi) is believed to have exceeded all other known floods, including that of March 1867, from profile and report of Tennessee Valley Authority.

Remarks.—Flow completely regulated by Watauga Lake.

113. DOE RIVER AT ELIZABETHTON, TENN.

Location.—Lat $36^{\circ}20'40''$, long $82^{\circ}12'37''$, on left bank 1,500 ft upstream from bridge on State Highway 91 at Elizabethton, Carter County, and 1 mile upstream from mouth.

Drainage area,—137 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,524.73 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 4,000 cfs and by slope-area measurement at 6,350 cfs.

Maxima.—January-February 1957: Discharge, 4,990 cfs 12:30 a.m. Feb. 1, (gage height, 5.65 ft).

1911-16, 1920-31, 1932 to December 1956: Discharge, 7,300 cfs July 30, 1940 (gage height, 6.75 ft).

Flood of May 21, 1901, reached a stage of 10.5 ft (discharge, 39,000 cfs) from report by Tennessee Valley Authority.

FLOODS OF JANUARY-FEBRUARY 1957 IN KENTUCKY

A151

114. WATAUGA RIVER AT ELIZABETHTON, TENN.

Location.—Lat $36^{\circ}21'21''$, long $82^{\circ}13'26''$, on left bank 25 ft upstream from bridge on U.S. Highway 19E at Elizabethton, Carter County, 0.6 mile downstream from Doe River, and at mile 25.9.

Drainage area.—692 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,486.23 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 8,000 cfs 5 a.m. Jan. 29 (gage height, 8.61 ft).

1925-49, 1953 to December 1956: Discharge, 75,100 cfs Aug. 14, 1940 (gage height, 20.87 ft), from rating curve extended above 29,000 cfs on basis of contracted-opening measurement of peak flow.

Maximum stage known, about 21 ft in May 1901 (discharge, 75,900 cfs), from high-water profile by Tennessee Valley Authority. Floods of 1886 and 1902 each reached a stage of about 19 ft and the flood of 1867 reached a stage of about 18 ft, from report by Tennessee Valley Authority.

Remarks.—Flow partly regulated by Watauga Lake, 10 miles upstream.

Mean discharge, in cubic feet per second, 1957

*Flow affected by regulation; daily means cannot be computed exactly from data shown.

115. BOONE LAKE AT SPURGEON, TENN.

Location.—Lat $36^{\circ}26'26''$, long $82^{\circ}26'16''$, at Boone Dam on South Fork Holston River in Sullivan County, Tenn., 0.7 mile northeast of Spurgeon, Washington County, Tenn., 1.3 miles downstream from Watauga River, and at mile 18.6.

Drainage area.—1,840 sq mi.

Gage-height record.—Water-stage recorder. Datum of gage is at mean sea level, datum of 1929, supplementary adjustment of 1936.

Maxima.—January-February 1957: Contents at 12 p.m., 70,800 cfs-days Feb. 1 (elev., 1,370.36 ft).

1952 to December 1956: Contents, 98,100 cfs-days June 10, 1953 (elev., 1,384.52 ft).

Remarks.—Storage capacity, 99,200 cfs-days (elevation, 1,385.0 ft) of which 75,700 cfs-days is controlled storage. Records furnished by Tennessee Valley Authority.

Elevation, in feet, and contents, in cfs-days at 12 p.m. of indicated day, 1957

117. SOUTH FORK HOLSTON RIVER AT KINGSPORT, TENN.

Location.—Lat $36^{\circ}31'51''$, long $82^{\circ}33'29''$, on left bank 1,000 ft downstream from new bridge on State Highway 81, $1\frac{1}{4}$ miles upstream from Reedy Creek, and 3-3/4 miles upstream from confluence with North Fork Holston River.

Drainage area.—1,935 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,175.84 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January–February 1957: Discharge, 15,800 cfs 4–5 a.m. Feb. 10 (gage height, 6.67 ft).

1925 to December 1956: Discharge, 68,800 cfs Aug. 14, 1940 (gage height, 18.80 ft, at site 2 miles upstream at datum 8.47 ft higher).

Flood of May 1901 reached a stage of about 23 ft, original site and datum (discharge, 110,000 cfs), the flood of March 1867 was about 0.5 ft lower and the flood of March 1791 was about 3 ft lower than the flood of May 1901, from reports by Tennessee Valley Authority.

Remarks.—Flow regulated by South Holston, Watauga, Boone, and Fort Patrick Henry Lakes. Some diversion upstream by city of Kingsport, Tennessee Eastman Corporation, and Holston Ordnance Works.

*Flow affected by regulation; daily means cannot be computed exactly from data shown.

118. NORTH FORK HOLSTON RIVER NEAR SALTVILLE, VA.

Location.—Lat $36^{\circ}53'48''$, long $81^{\circ}44'47''$, on right bank 0.5 mile upstream from Cedar Branch bridge, 1.5 miles northeast of Saltville, Smyth County, and 7.8 miles downstream from Laurel Creek.

Drainage area.—222 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,703.53 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements to 7,200 cfs and by slope-area measurement at 16,500 cfs.

Maxima.—January-February 1957: Discharge, 16,500 cfs 9 p.m. Jan. 29 (gage height, 13.20 ft).

1907-8, 1920 to December 1956: Discharge, 13,100 cfs Feb. 18, 1944 (gage height, 10.75 ft).

Mean discharge, in cubic feet per second, 1957

119 NORTH FORK HOLSTON RIVER AT HOLSTON, VA.

Location.—Lat $36^{\circ}46'29''$, long $82^{\circ}04'22''$, on left bank at downstream side of bridge on U.S. Highway 19, 100 ft downstream from Greendale Creek, 0.4 mile upstream from Garrett Creek, 0.5 mile east of Holston, Washington County, and 0.6 mile upstream from Little Moccasin Creek.

Drainage area.—402 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,437.11 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 12,000 cfs and by slope-area measurement at 24,200 cfs.

Maxima.—January–February 1957: Discharge, 24,300 cfs 12 p.m. Jan. 29 (gage height, 16.50 ft).

1951 to December 1956: Discharge, 12,800 cfs Apr. 16, 1956 (gage height, 12.93 ft).

FLOODS OF JANUARY-FEBRUARY 1957 IN KENTUCKY

A161

121. NORTH FORK HOLSTON RIVER NEAR GATE CITY, VA.

Location.—Lat $36^{\circ}36'31''$, long $82^{\circ}34'05''$, on left bank 100 ft upstream from bridge on U.S. Highway 23, 1.6 miles downstream from Big Moccasin Creek and 2.1 miles southeast of Gate City, Scott County.

Drainage area.—672 sq mi.

Gage-height record.—Water-stage recorder graph except Jan. 14–23, 26. Datum of gage is 1,197.56 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Discharge for periods of no gage-height record estimated on basis of records for nearby streams.

Maxima.—January–February 1957: Discharge, 28,700 cfs 12 m Jan. 30 (gage height, 16.73 ft).

1931 to December 1956: Discharge, 23,700 cfs Aug. 14, 1940 (gage height, 14.75 ft).

Mean discharge, in cubic feet per second, 1957

122. HOLSTON RIVER AT SURGOINSVILLE, TENN.

Location.—Lat $36^{\circ}28'19''$, long $82^{\circ}50'50''$, on right bank, 1,500 ft upstream from Surgoinsville Creek and county bridge at Surgoinsville, Hawkins County, 9.8 miles upstream from Big Creek, and at mile 118.4. Records include flow of Surgoinsville Creek.

Drainage area.—2,874 sq mi, includes that of Surgoinsville Creek.

Gage-height record.—Water-stage recorder graph, Datum of gage is 1,088.46 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January–February 1957: Discharge, 45,100 cfs 3–5 p.m. Jan. 30 (gage height, 14.32 ft).

1940 to December 1956: Discharge, 59,600 cfs Feb. 18, 1944 (gage height, 17.48 ft).

Floods of 1867 and 1901 reached stages of about 31 ft and 28 ft, respectively, from profile by Tennessee Valley Authority. Flood of 1867 exceeded all other known floods, including that of 1791.

Remarks.—Flow partly regulated by South Holston, Watauga, Boone, and Fort Patrick Henry Lakes.

*Affected by regulation; daily means cannot be computed exactly from data shown.

123. BIG CREEK NEAR ROGERSVILLE, TENN.

[Crest-stage station]

Location.—Lat $36^{\circ}25'34''$, long $82^{\circ}57'07''$, on left bank 300 ft upstream from county highway bridge, 2.0 miles upstream from mouth, and 3.0 miles northeast of Rogersville, Hawkins County.

Drainage area.—47.3 sq mi (measured by Tennessee Valley Authority on $7\frac{1}{2}$ -minute planimetric maps, scale, 1:34,000).

Gage-height record.—Crest stages only.

Discharge record.—Peak discharges from rating curve extended above 2,000 cfs.

Maxima.—January-February 1957: Discharge, 3,180 cfs Jan. 31 (gage height, 6.73 ft). April 1941 to June 1949, December 1954 to December 1956: Discharge, 3,060 cfs Jan. 20, 1947 (gage height, 6.59 ft).

124. CHEROKEE LAKE NEAR JEFFERSON CITY, TENN.

Location.—Lat $36^{\circ}10'00''$, long $83^{\circ}29'55''$, at Cherokee Dam on Holston River, 0.3 mile upstream bridge on State Highway 92, 2.7 miles upstream from Mill Spring Creek, 2.8 miles north of Jefferson City, Jefferson County, Tenn., and at mile 52.3.

Drainage area.—3,429 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is at mean sea level, datum of 1929, supplementary adjustment of 1936.

Maxima.—January-February 1957: Contents at 12 p.m., 363,100 cfs-days Feb. 11 (elevation, 1,039.93 ft).

1941 to December 1956: Contents, 779,400 cfs-days May 11, 1944 (elevation, 1,074.37 ft).

Remarks.—Storage capacity, 789,200 cfs-days (elevation, 1,075.0 ft) of which 742,700 cfs-days is controlled storage. Records furnished by Tennessee Valley Authority.

Elevation, in feet, and contents, in cfs-days at 12 p.m. of indicated day, 1957

125. HOLSTON RIVER NEAR JEFFERSON CITY, TENN.

Location.—Lat $36^{\circ}10'03''$, long $83^{\circ}30'10''$, on left bank 250 ft upstream from bridge on State Highway 92, 0.2 mile downstream from Cherokee Dam, 2.5 miles upstream from Mill Spring Creek, and 3 miles north of Jefferson City, Jefferson County.

Drainage area.—3,429 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 900.00 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 25,900 cfs 5:30 p.m. Feb. 11 (gage height, 32.19 ft).

1936 to December 1956: Discharge, 58,700 cfs Aug. 15, 1940 (gage height, 41.82 ft).

Floods of 1867 and 1901 reached stages of about 60 ft and 53 ft, respectively, from profile by Tennessee Valley Authority. Flood of 1867 exceeded all other known floods, including that of 1791.

Remarks.—Flow regulated by South Holston, Watauga, Boone, Fort Patrick Henry, and Cherokee Lakes.

Mean discharge, in cubic feet per second, 1957

126. LITTLE RIVER NEAR MARYVILLE, TENN.

Location.—Lat $35^{\circ}47'10''$, long $83^{\circ}53'04''$, on right bank on downstream side of bridge on U.S. Highway 411, 0.8 mile downstream from Crooked Creek, 5.0 miles east of Maryville, Blount County, and at mile 17.3.

Drainage area.—269 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 850.00 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 12,600 cfs 1:30 a.m. Feb. 1 (gage height, 21.18 ft).

1951 to December 1956: Discharge, 13,300 cfs Jan. 16, 1954 (gage height, 18.44 ft).

Floods of March 1875 and April 1920 reached stages of 31.0 and 24.1 ft, respectively.

Flood of Mar. 29, 1951, reached a stage of 21.05 ft (discharge, 19,200 cfs) from flood-marks.

127. TELLICO RIVER AT TELLICO PLAINS, TENN.

Location.—Lat 35°21'42", long 84°16'44", on right bank 200 ft upstream from bridge on Tellico Plains-Rafter road, 0.4 mile downstream from Laurel Creek, 0.8 mile east of Tellico Plains, Monroe County, and at mile 28.2.

Drainage area.—118 sq mi.

Gage-height record.—Water-stage recorder graph except 10 p.m. Jan. 31 to 12 m. Feb. 1 for which graph was drawn on basis of adjacent graph. Ice affected gage-height records on Jan. 19. Datum of gage is 846.64 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 9,600 cfs.

Maxima.—January–February 1957: Discharge, 17,500 cfs 8 p.m. Jan. 31 (gage height, 13.60 ft).

1925 to December 1956: Discharge, 15,100 cfs Mar. 29, 1951 (gage height, 12.82 ft).

Flood of May 1840 reached a stage of about 15 ft (discharge, 21,500 cfs) from reports from Tennessee Valley Authority.

128. CLINCH RIVER AT CEDAR BLUFF, VA.

[Gaging station discontinued in 1946]

Location.—Lat $37^{\circ}05'20''$, long $81^{\circ}46'$, at highway bridge at mouth of Indian Creek in town of Cedar Bluff, Tazewell County, 400 ft upstream from Middle Creek, and 1.1 miles east of Richlands.

Drainage area.—125 sq mi, includes that of Indian Creek.

Gage-height record.—Floodmarks only. Altitude of gage is 1,940 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 800 cfs and extended above by logarithmic plotting.

Maxima.—January 1957: Gage height, 14.41 ft Jan. 29.

1944 to September 1946: Discharge, 4,800 cfs about 6 a.m. Jan. 8, 1946 (gage height, 7.4 ft, from floodmark).

Flood in 1901 reached a stage of about 16 ft from floodmark in old mill.

129. CLINCH RIVER AT RICHLANDS, VA.

Location.—Lat $37^{\circ}05'10''$, long $81^{\circ}46'52''$, on right bank 1 mile southeast of Richlands, Tazewell County, 1.6 miles downstream from Middle Creek, and 2.2 miles upstream from Big Creek.

Drainage area.—139 sq mi.

Gage-height record.—Water-stage recorder graph except Jan. 1-6, Jan. 29 to Feb. 1 and Feb. 12-21. A stage graph was drawn for period Jan. 29 to Feb. 1 on basis of crest stage from floodmark and records for nearby stations. Datum of gage is 1,923.99 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 4,800 cfs and by contracted-opening measurement at 9,650 cfs. Discharge for periods Jan. 1-6 and Feb. 12-21 estimated on basis of records for nearby station.

Maxima.—January-February 1957: Discharge, 9,640 cfs 6 p.m. Jan. 29 (gage height, 19.3 ft, from floodmark in gage house).

1946 to December 1956: Discharge, 5,080 cfs May 19, 1953 (gage height, 13.23 ft).

Mean discharge, in cubic feet per second, 1957

130. LITTLE RIVER AT WARDELL, VA.

[Gaging station discontinued in 1952]

Location.—Lat $37^{\circ}02'16''$, long $81^{\circ}47'52''$, on right bank 50 ft upstream from Katies Branch, 0.5 mile downstream from Indian Creek, 0.5 mile northwest of Wardell, Tazewell County, and 16.0 miles upstream from mouth.

Drainage area.—103 sq mi.

Gage-height record.—Floodmarks only. Datum of gage is 2,033.01 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 960 cfs and by slope-area measurements of 1,840 cfs.

Maxima.—January 1957: Gage height, 14.34 ft Jan. 29.

1949 to September 1952: Discharge, 1,830 cfs at 7 a.m. Feb. 2, 1950 (gage height, 8.05 ft).

131. CEDAR CREEK NEAR LEBANON, VA.

Location.—Lat $36^{\circ}54'29''$, long $82^{\circ}02'20''$, on right bank 800 ft upstream from Roaring Spring Creek, 1.9 miles upstream from Little Cedar Creek, and 2.3 miles east of Lebanon, Russell County.

Drainage area.—51.5 sq mi.

Gage-height record.—Water-stage recorder graph. Stage outside of gage well was up to 0.6 ft higher than recorded. Datum of gage is 1,928.96 ft above mean sea level (Tennessee Valley Authority bench mark).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,300 cfs and by contracted-opening measurement at 2,710 cfs.

Maxima.—January-February 1957: Discharge, 2,740 cfs 4 p.m. Jan. 29 (gage height, 4.48 ft in gage well, 4.7 ft outside).

1952 to December 1956: Discharge, 2,650 cfs Mar. 16, 1955 (gage height, 4.27 ft).

133. GUEST RIVER AT COEBURN, VA.

Location.—Lat $36^{\circ}55'45''$, long $82^{\circ}27'23''$, on right bank at downstream side of bridge on State Highway 72, 1.0 mile southeast of Coeburn, Wise County, 1.4 miles upstream from Jaybird Branch, 1.8 miles downstream from Pine Camp Creek, and 6 miles upstream from mouth.

Drainage area.—87.3 sq mi.

Gage-height record.—Water-stage recorder graph except for Jan. 29 (6 p.m.) to Feb. 1 (8 p.m.) and Feb. 21–28. Graph was drawn for Jan. 29 to Feb. 1 on basis of flood crest, shape of recorder trace, and records for nearby streams. Datum of gage is 1,925.00 ft above mean sea level (Interstate Railway bench mark).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 3,500 cfs and by slope-area measurement at 5,900 cfs. Discharge for period of no gage-height record estimated on basis of records for nearby stations.

Maxima.—January–February 1957: Discharge, 6,360 cfs 12 p.m. Jan. 29 (gage height, 14.20 ft, from floodmarks).

1949 to December 1956: Discharge, 4,020 cfs Apr. 16, 1956 (gage height, 10.83 ft).

134. STONY CREEK AT FORT BLACKMORE, VA.

[Crest-stage stations; gaging station discontinued 1952]

Location.—Lat $36^{\circ}46'30''$, long $82^{\circ}34'50''$, at Fort Blackmore, Scott County, 2,000 ft upstream from mouth, and 9.5 miles north of Gate City.

Drainage area.—41.4 sq mi.

Gage-height record.—Crest stages only. Datum of gage is 1,270.17 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 1,200 cfs and extended above by logarithmic plotting.

Maxima.—January 1957: Discharge, 2,220 cfs Jan. 29 (gage height, 6.12 ft).

1949 to December 1956: Discharge, 2,550 cfs Apr. 16, 1956, (gage height, 6.55 ft).

Flood of Jan. 28, 1918, reached a stage of about 9 ft (discharge, 12,000 cfs) and flood of Feb. 14, 1948, was lower than that of 1918 by 1.3 to 2.0 ft at points 1 to 4 miles upstream, from Tennessee Valley Authority, Division of Water Control Planning Report No. 0-5981.

135. COPPER CREEK NEAR GATE CITY, VA.

Location.—Lat $36^{\circ}40'26''$, long $82^{\circ}33'57''$, at highway bridge, 0.2 mile upstream from Plank Camp Creek, 1.1 miles downstream from Obeys Creek, and 2.6 miles northeast of Gate City, Scott County.

Drainage area.—106 sq mi.

Gage-height record.—Water-stage recorder graph except Feb. 10–28. Altitude of gage is 1,290 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Discharge for period of no gage-height record estimated on basis of records for nearby stations.

Maxima.—January–February 1957: Discharge, 3,200 cfs 4 a.m. Jan. 30 (gage height, 9.98 ft).

1947 to December 1956: Discharge, 6,800 cfs Jan. 30, 1950 (gage height, 13.0 ft from graph based on gage readings).

136. CLINCH RIVER AT SPEERS FERRY, VA.

Location.—Lat $36^{\circ}38'55''$, long $82^{\circ}45'02''$, on right bank 100 ft downstream from bridge on U.S. Highway 58, 0.5 mile downstream from Copper Creek, 0.8 mile northwest of Speers Ferry, Scott County, and 1.8 miles downstream from Clinchport.

Drainage area.—1,126 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,196.52 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements. Maxima.—January-February 1957: Discharge, 45,300 cfs 3 p.m. Jan. 30 (gage height, 28.92 ft).

1920 to December 1956: Discharge, 37,200 cfs Feb. 3, 1923 (gage height, 25.85 ft).

1895 to December 1956: Discharge, about 42,000 cfs Feb. 28, 1902 (gage height, 26.6 ft, observed by U.S. Weather Bureau, site 400 ft downstream and at datum about 1 ft higher).

Flood in February 1862 reached a stage of 33 ft, from information furnished by Tennessee Valley Authority.

137. NORTH FORK CLINCH RIVER AT DUFFIELD, VA.

Location.—Lat $36^{\circ}42'40''$, long $82^{\circ}47'45''$, on right bank at upstream side of bridge on U.S. Highways 58 and 421, 0.2 mile downstream from Spurlock Branch, 0.5 mile south of Duffield, Scott County, and 1.6 miles upstream from Harris Branch.

Drainage area.—23.1 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,814.15 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January–February 1957: Discharge, 789 cfs 6 p.m. Jan. 28 (gage height, 7.34 ft).

1952 to December 1956: Discharge, 800 cfs Apr. 15, 1956 (gage height, 7.40 ft).

138. CLINCH RIVER ABOVE TAZEWELL, TENN.

Location.—Lat $36^{\circ}25'30''$, long $83^{\circ}23'54''$, on right bank 0.4 mile upstream from Grissom Island, 4.6 miles downstream from Big War Creek, 10 miles east of Tazewell, Claiborne County, and at mile 159.8.

Drainage area.—1,474 sq mi. At site used 1919-27, 1,548 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,060.7 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurement below 43,000 cfs.

Maxima.—January-February 1957: Discharge, 51,100 cfs 4:30 a.m. Jan. 31 (gage height, 21.00 ft).

1918 to December 1956: Discharge, 39,700 cfs Feb. 4, 1923 (gage height, 20.3 ft, at site 23 miles downstream at datum 102.7 ft lower).

Flood of February 1862 reached a stage of about 24 ft, from information by local resident (discharge, 66,000 cfs), from report by Tennessee Valley Authority.

Mean discharge, in cubic feet per second, 1957

139. POWELL RIVER AT BIG STONE GAP, VA.

Location.—Lat $36^{\circ}52'08''$, long $82^{\circ}46'32''$, on right bank 10 ft upstream from bridge on U.S. Highway 23 at Big Stone Gap, Wise County, 1 mile upstream from South Fork Powell River and 2.5 miles downstream from Pigeons Creek.

Drainage area.—112 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,459.07 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,800 cfs and by slope-area measurement at 11,000 cfs.

Maxima.—January–February 1957: Discharge, 11,000 cfs 3 p.m. Jan. 29 (gage height, 9.67 ft).

1944 to December 1956: Discharge, 16,500 cfs Jan. 7, 1946 (gage height, 9.8 ft, from floodmark).

140. SOUTH FORK POWELL RIVER AT BIG STONE GAP, VA.

[Crest-stage gage; gaging station discontinued 1947]

Location.—Lat $36^{\circ} 51' 54''$, long $82^{\circ} 46' 16''$, at bridge on U.S. Highway 23 in town of Big Stone Gap, Wise County, 1.6 miles upstream from Powell River and 1.9 miles downstream from Butcher Creek.

Drainage area.—40 sq mi.

Gage-height record.—Crest stage only. Altitude of gage is 1,470 ft (from topographic map).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,500 cfs.

Maxima.—January 1957: Discharge, 3,550 cfs Jan. 29 (gage height, 8.62 ft).

1944-47, 1951 to December 1956: Discharge, 3,100 cfs Jan. 7, 1946 (gage height, 8.0 ft, from floodmark).

141. NORTH FORK POWELL RIVER AT PENNINGTON GAP, VA.

[Crest-stage station; gaging station discontinued 1951]

Location.—Lat $36^{\circ}46'26''$, long $83^{\circ}01'59''$, at highway bridge 0.8 mile north of town of Pennington Gap, Lee County, 1.3 miles downstream from Straight Creek, and 4.5 miles upstream from Powell River.

Drainage area.—70 sq mi.

Gage-height record.—Crest stage only. Altitude of gage is 1,365 ft (by barometer).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 2,300 cfs and by slope-area measurements at 4,500 and 9,700 cfs.

Maxima.—January 1957: Discharge, 4,430 cfs Jan. 29 (gage height, 8.70 ft).

1944 to December 1956: Discharge, 9,700 cfs Jan. 7, 1946 (gage height, 12.1 ft).

142. POWELL RIVER NEAR JONESVILLE, VA.

Location.—Lat $36^{\circ}39'42''$, long $83^{\circ}05'42''$, on right bank 35 ft downstream from highway bridge 2 miles southeast of Jonesville, Lee County, and 10 miles upstream from Wallen Creek.

Drainage area.—319 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,259.08 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 19,800 cfs 2 a.m. Jan. 30 (gage height, 26.87 ft).

1931 to December 1956: Discharge, 30,000 cfs Jan. 8, 1946 (gage height, 30.8 ft).

143. POWELL RIVER NEAR ARTHUR, TENN.

Location.—Lat $36^{\circ}32'30''$, long $83^{\circ}37'49''$, on left bank 500 ft upstream from bridge on U.S. Highway 25 E, 2.3 miles east of Arthur, Claiborne County, and 2.4 miles downstream from Indian Creek.

Drainage area.—685 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 1,045.84 ft above mean sea level (Tennessee River Survey datum).

Discharge record.—Stage-discharge relation defined by current-meter measurements below 23,000 cfs.

Maxima.—January-February 1957: Discharge, 23,500 cfs 5 a.m. Jan. 30 (gage height, 22.07 ft).

1919 to December 1956: Discharge, 33,000 cfs Jan. 9, 1946 (gage height, 27.15 ft, from floodmark) from rating curve extended above 23,000 cfs by indirect measurement at 32,000 cfs.

Maximum stage known, about 27.5 ft in March 1826 (discharge, 34,000 cfs).

The flood of Jan. 29, 1918, reached a stage of about 27.2 ft (discharge, 33,000 cfs) from reports of Tennessee Valley Authority.

144. NORRIS LAKE NEAR NORRIS, TENN.

Location.—Lat $36^{\circ}13'29''$, long $84^{\circ}05'29''$, at Norris Dam on Clinch River, $2\frac{1}{2}$ miles northwest of Norris, Anderson County, Tenn., and at mile 79.8.

Drainage area.—2,912 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is at mean sea level, adjustment of 1921, and 0.11 ft above mean sea level, datum of 1929, supplementary adjustment of 1936. Elevations given herein are referred to adjustment of 1912.

Maxima.—January–February 1957: Contents at 12 p.m., 756,400 cfs-days Feb. 4 (elev., 1,031.10 ft).

Remarks.—Storage capacity, 1,294,200 cfs-days (elev., 1,034.0 ft) of which 1,150,000 cfs-days is controlled storage. Records furnished by Tennessee Valley Authority.

Elevation, in feet, and contents, in cfs-days at 12 p.m. of indicated day 1957

145. CLINCH RIVER BELOW NORRIS DAM, TENN.

Location.—Lat $36^{\circ}12'56''$, long $84^{\circ}04'56''$, 0.5 mile upstream from Clear Creek, 1.0 mile downstream from Norris Dam, 1.5 miles north of Norris, Anderson County, and at mile 78.8.

Drainage area.—2,913 sq mi. At site used 1904-27, 3,056 sq mi.

Gage-height record.—Water-stage recorder graph. Datum of gage is 819.11 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 26,600 cfs 1-11 a.m., Feb. 12 (gage height, 11.65 ft).

1903 to December 1956: Discharge, 87,000 cfs Mar. 5, 1917 (gage height, 38.5 ft, from graph based on gage readings, at site 19.6 miles downstream at railroad bridge at Clinton, at datum 42.49 ft lower), from rating curve extended above 62,000 cfs.

Flood of Mar. 11, 1826, reached a stage of 43.5 ft (discharge, 130,000 cfs) at railroad bridge at Clinton, from reports by Tennessee Valley Authority. Flood of March 31, 1886, reached a stage of 41.3 ft, revised, (discharge, 113,000 cfs) at railroad bridge at Clinton. Flood of Feb. 24, 1862, equalled that of Mar. 31, 1886, from reports by Tennessee Valley Authority.

Remarks.—Flow regulated by Norris Lake.

*Affected by regulation; daily means cannot be computed exactly from data shown.

146. COAL CREEK AT LAKE CITY, TENN.

[Crest-stage station]

Location.—Lat $36^{\circ}13'14''$, long $84^{\circ}09'27''$, on right bank at U.S. Highway 25W bridge at Lake City, Anderson County, 0.1 mile upstream from Right Fork, and 0.1 mile downstream from Louisville and Nashville Railroad bridge.

Drainage area.—24.5 sq mi (measured by Tennessee Valley Authority on $7\frac{1}{2}$ -minute planimetric maps, scale, 1:24,000).

Gage-height record.—Crest stages only.

Discharge record.—Peak discharges from rating curve defined by current-meter measurements to 3,600 cfs.

Maxima.—January-February 1957: Discharge, 2,580 cfs Jan. 31 (gage height, 12.02 ft). June 1932 to April 1934, May 1954 to December 1956: Discharge, 3,400 cfs Mar. 19, 1933 (gage height, 13.0 ft).

The Tennessee Valley Authority estimated a discharge of 8,400 cfs for the flood of Mar. 23, 1929.

147. BUFFALO CREEK AT NORRIS, TENN.

[Crest-stage station]

Location.—Lat $36^{\circ}11'05''$, long $84^{\circ}03'41''$, on right bank at culvert on State Highway 71 (Norris Freeway), 1.0 mile southeast of Norris, Anderson County.

Drainage area.—9.45 sq mi (measured by Tennessee Valley Authority on $7\frac{1}{2}$ -minute planimetric maps, scale, 1:24,000).

Gage-height record.—Crest stages only.

Discharge record.—Peak discharges from rating curve extended above 610 cfs.

Maxima.—January-February 1957: Discharge, 1,130 cfs Jan. 31, (gage height, 9.03 ft). August 1947 to January 1951, May 1954 to December 1956: Discharge, 757 cfs Feb. 13, 1948 (gage height, 7.91 ft).

148. TENNESSEE RIVER AT CHATTANOOGA, TENN.

Location.—Lat $35^{\circ}05'12''$, long $85^{\circ}16'43''$, on right bank at Rivermont Golf and Country Club, half a mile downstream from South Chickamauga Creek, 3 miles downstream from Chickamauga Dam, $3\frac{1}{2}$ mile upstream from Walnut Street Bridge in Chattanooga, Hamilton County, and at mile 467.6.

Drainage area.—21,400 sq mi, approximately.

Gage-height record.—Water-stage recorder graph. Datum of gage is 621.12 ft above mean sea level, datum of 1929, supplementary adjustment of 1936.

Discharge record.—Stage-discharge relation defined by current-meter measurements.

Maxima.—January-February 1957: Discharge, 208,000 cfs Feb. 2; gage height, 34.22 ft (32.24 at Walnut Street) Feb. 2.

1874 to December 1956: Discharge, 410,000 cfs (gage height, 53.8 ft, at Walnut Street).

Stage known, 57.9 ft, at Walnut Street, Mar. 11, 1867 (discharge about 459,000 cfs).
